Neuropsychology David Andrewes.2013-05-13 This comprehensive textbook provides an up-to-date and accessible account of the theories that seek to explain the complex relationship between brain and behaviour. Drawing on the latest research findings from the disciplines of neuropsychology, neuroscience, cognitive neuroscience and cognitive neuropsychology, the author provides contemporary models of neuropsychological processes. The book provides a fresh perspective that takes into account the modern advances of functional neuroimaging and other new research techniques. The emphasis at all times is on bridging the gap between theory and practice - discussion of theoretical models is framed in a clinical context and the author makes frequent use of case studies to illustrate the clinical context. There is coverage of the neuropsychology of disorders associated with areas such as perception, attention, memory and language, emotion, and movement. A third-generation text, this book uniquely aims to integrate these different areas by describing the common influences of these functions. Following on from this there is information on the clinical management of patients in the area of recovery and rehabilitation. These last chapters focus on the author's own experience and illustrate the importance of a more systematic approach to intervention, which takes into account theoretical views of recovery from brain damage. *Neuropsychology: From Theory to Practice* is the first comprehensive textbook to cover research from all disciplines committed to understanding neuropsychology. It will provide a valuable resource for students, professionals and clinicians.

Remote Sensing of Plant Biodiversity Jeannine Cavender-Bares,John A. Gamon,Philip A. Townsend.2020-06-22 This Open Access volume aims to methodologically improve our understanding of biodiversity by linking disciplines that incorporate remote sensing, and uniting data and perspectives in the fields of biology, landscape ecology, and geography. The book provides a framework for how biodiversity can be detected and evaluated—focusing particularly on plants—using proximal and remotely sensed hyperspectral data and other tools such as LiDAR. The volume, whose chapters bring together a large cross-section of the biodiversity community engaged in these methods, attempts to establish a common language across disciplines for understanding and implementing remote sensing of biodiversity across scales. The first part of the book offers a potential basis for remote detection of biodiversity. An overview of the nature of biodiversity is described, along with ways for determining traits of plant biodiversity through spectral analyses across spatial scales and linking spectral data to the tree of life. The second part details what can be detected spectrally and remotely. Specific instrumentation and technologies are described, as well as the technical challenges of detection and data synthesis, collection and processing. The third part discusses spatial resolution and integration across scales and ends with a vision for developing a global biodiversity monitoring system. Topics include spectral and functional variation across habitats and biomes, biodiversity variables for global scale assessment, and the prospects and pitfalls in remote sensing of biodiversity at the global scale.
