*Change in concentration of ethyl acetate for hydrolysis with NaOH. Effects on the rate of reaction and the specific rate constant* Sumaanyu Maheshwari.2016-11-29 Internship Report from the year 2016 in the subject Chemistry - Organic Chemistry, grade: A, , course: IB Chem HL, language:

English, abstract: During our classes on Organic Chemistry we learnt about hydrolysis of an ester. I wondered if this chemical breakdown of a compound could happen in a reaction with something other than water. After some research, I came to know that this process could occur by reacting an alkali instead of water. I wanted to link this, to the chapter Kinetics that we just finished. For the internal assessment, I thought of checking for the dependency of concentration on such a reaction. So, I decided to find out how fast would the reaction take place if I changed the concentration of ethyl acetate from 0,0025 V/V to 0,005 V/V. I want to be a scientist who develops performance devices and enhanced models that stimulate and better the chemical reacting system's functional parameters. This concept of reaction rate, as told to me by my father, has paramount importance in the profession I yearn to be in. Although I know that increasing the concentration would increase the rate of reaction but I don't know to what extent or by how much will it increase. In our classes we were taught about this relation, but I wanted to check for myself if it actually holds true. I thus wished to carry out an experiment to check that what we learnt in our class theoretically, is practically observed too. So the aim of my experiment is to find out to what extent does the rate of reaction change while I change the concentration, at a particular temperature. I was also interested in finding out if there would be any consequent impact on the specific rate constant.

Residue Reviews Francis A. Gunther, Jane Davies Gunther. 2013-11-11 That residues of pesticide and other contaminants in the total environment are of concern to everyone everywhere is attested by the reception accorded previous volumes of Residue Reviews and by the gratifying enthusiasm, sincerity, and efforts shown by all the individuals from whom manuscripts have been solicited.

Despite much propaganda to the contrary, there can never be any serious question that pest-control chemicals and food-additive chemicals are essential to adequate food production, manufacture, marketing, and storage, yet without continuing surveillance and intelligent control some of those that persist in our foodstuffs could at times conceivably endanger the public health. Ensuring safety-in-use of these many chemicals is a dynamic challenge, for established ones are continually being displaced by newly developed ones more acceptable to food technologists, pharmacologists, toxicologists, and changing pest-control requirements in progressive food-producing economies.

These matters are of genuine concern to increasing numbers of governmental agencies and legislative bodies around the world, for some of these chemicals have resulted in a few mishaps from improper use. Adequate safety-in-use evaluations of any of these chemicals persisting into our foodstuffs are not simple matters, and they incorporate the considered judgments of many individuals highly trained in a variety of complex biological, chemical, food technological, medical, pharmacological, and toxicological disciplines.
