Steam Turbine Governing and Overspeed Protection .1998-03-06 The changing electricity market is increasing demands on the governing and overspeed protection systems that ensure safe operation and control steam turbines in conventional cycle, CCGT and CHP applications. Electricity generators are now coming under increasing commercial pressure to respond more rapidly to changes in grid load and frequency-regulating requirements. High-integrity systems are, therefore, required to monitor and control prime movers during rapid load transients affecting supply and demand. The necessary capacity for this rapid load changing is primarily provided by steam turbine plant, as much of the new gas-fired plant is limited in its ability to meet the need for flexible operation.

*Turbine Steam Path Performance* William P. Sanders. 1986

Study of Advanced Radial Outflow Turbine for Solar Steam Rankine Engines Cecil Martin. 1979 The performance characteristics of various steam Rankine engine configurations for solar electric power generation were investigated. A radial outflow steam turbine was investigated to determine: (1) a method for predicting performance from experimental data; (2) the flexibility of a single design with regard to power output and pressure ratio; and (3) the effect of varying the number of turbine stages. All turbine designs were restricted to be compatible with commercially available gearboxes and generators. A study of several operating methods and control schemes for the steam Rankine engine shows that from an efficiency and control simplicity standpoint, the best approach is to hold turbine inlet temperature constant, vary turbine inlet pressure to match load, and allow condenser temperature to float maintaining constant heat rejection load.
