**Out in the Sun** James A. Suttor. 2016-07-27 I had an Australian country boyhood, full of pranks, fun, and laughter and risk-taking behaviours with my friends. In Sydney to do my apprenticeship, I fell into the wrong crowd and started on a path that almost led to my death. At age seventeen, I had a terrible accident, resulting in a serious brain injury. After many months of hospitalization and rehabilitation, I resumed my life, acquired further education and work-related skills, met my wife, and have had some wonderful adventures. I have enjoyed my life immensely since my accident. Meeting God was the best of all. I have written my story in the hope that it might provide some inspiration for the reader. I know that when a difficult thing happens, Jesus is beside me, and by just having him there, I know that everything is going to work out for the better. You can do bad things in

your life, but just saying yes to Jesus can turn those things to a positive side.

**Neural Masses and Fields: Modelling the Dynamics of Brain Activity** Karl Friston. 2015-05-25 Biophysical modelling of brain activity has a long and illustrious history and has recently profited from technological advances that furnish neuroimaging data at an unprecedented spatiotemporal

resolution. Neuronal modelling is a very active area of research, with applications ranging from the characterization of neurobiological and cognitive processes, to constructing artificial brains in silico and building brain-machine interface and neuroprosthetic devices. Biophysical modelling has always benefited from interdisciplinary interactions between different and seemingly distant fields; ranging from mathematics and engineering to linguistics and psychology. This Research Topic aims to promote such interactions by promoting papers that contribute to a deeper understanding of neural activity as measured by fMRI or electrophysiology. In general, mean field models of neural activity can be divided into two classes: neural mass and neural field models. The main difference between these classes is that field models prescribe how a quantity characterizing neural activity (such as average depolarization of a neural population) evolves over both space and time as opposed to mass models, which characterize activity over time only; by assuming that all neurons in a population are located at (approximately) the same point. This Research Topic focuses on both classes of models and considers several aspects and their relative merits that: span from synapses to the whole brain; comparisons of their predictions with EEG and MEG spectra of spontaneous brain activity; evoked responses, seizures, and fitting data - to infer brain states and map physiological parameters.
