Mathematical Optimization of Water Networks Alexander Martin,Kathrin Klamroth,Jens Lang,Günter Leugering,Antonio Morsi,Martin Oberlack,Manfred Ostrowski,Roland Rosen.2012-06-30 Water supply- and drainage systems and mixed water channel systems are networks whose high dynamic is determined and/or affected by consumer habits on drinking water on the one hand and by climate conditions, in particular rainfall, on the other hand. According to their size, water networks consist

of hundreds or thousands of system elements. Moreover, different types of decisions (continuous and discrete) have to be taken in the water management. The networks have to be optimized in terms of topology and operation by targeting a variety of criteria. Criteria may for example be economic, social or ecological ones and may compete with each other. The development of complex model systems and their use for deriving optimal decisions in water management is taking place at a rapid pace. Simulation and optimization methods originating in Operations Research have been used for several decades; usually with very limited direct cooperation with applied mathematics. The research presented here aims at bridging this gap, thereby opening up space for synergies and innovation. It is directly applicable for relevant practical problems and has been carried out in cooperation with utility and dumping companies, infrastructure providers and planning offices. A close and direct connection to the practice of water management has been established by involving application-oriented know-how from the field of civil engineering. On the mathematical side all necessary disciplines were involved, including mixed-integer optimization, multi-objective and facility location optimization, numerics for cross-linked dynamic transportation systems and optimization as well as control of hybrid systems. Most of the presented research has been supported by the joint project „Discret-continuous optimization of dynamic water systems“ of the federal ministry of education and research (BMBF).

*Cybersecurity in France* Philippe Baumard.2017-05-02 This Brief presents the overarching framework in which each nation is developing its own cyber-security policy, and the unique position adopted by France. Modern informational crises have penetrated most societal arenas, from healthcare, politics, economics to the conduct of business and welfare. Witnessing a convergence between information warfare and the use of "fake news", info-destabilization, cognitive warfare and cyberwar, this book brings a unique perspective on modern cyberwarfare campaigns, escalation and de-escalation of cyber-conflicts. As organizations are more and more dependent on information for the continuity and stability of their operations, they also become more vulnerable to cyber-destabilization, either genuine, or deliberate for the purpose of gaining geopolitical advantage, waging wars, conducting intellectual theft and a wide range of crimes. Subsequently, the regulation of cyberspace has grown into an international effort where public, private and sovereign interests often collide. By analyzing the particular case of France national strategy and capabilities, the authors investigate the difficulty of obtaining a global agreement on the regulation of cyber-warfare. A review of the motives for disagreement between parties suggests that the current regulation framework is not adapted to the current technological change in the cybersecurity domain. This book suggests a paradigm shift in handling and anchoring cyber-regulation into a new realm of behavioral and cognitive sciences, and their application to machine learning and cyber-defense.

Synchrotron Light Sources and Free-Electron Lasers Eberhard J. Jaeschke,Shaukat Khan,Jochen R. Schneider,Jerome B. Hastings.2016-05-27 Hardly any other discovery of the nineteenth century did have such an impact on science and technology as Wilhelm Conrad Röntgen's seminal find of the X-rays. X-ray tubes soon made their way as excellent instruments for numerous applications in medicine, biology, materials science and testing, chemistry and public security. Developing new radiation sources with higher brilliance and much extended spectral range resulted in stunning developments like the electron synchrotron and electron storage ring and the freeelectron laser. This handbook highlights these developments in fifty chapters. The reader is given not only an inside view of exciting science areas but also of design concepts for the most advanced light sources. The theory of synchrotron radiation and of the freeelectron laser, design examples and the technology basis are presented. The handbook presents advanced concepts like seeding and harmonic generation, the booming field of Terahertz radiation sources and upcoming brilliant light sources driven by laser-plasma accelerators. The applications of the most advanced light sources and the advent of nanobeams and fully coherent x-rays allow experiments from which scientists in the past could not even dream. Examples are the diffraction with nanometer resolution, imaging with a full 3D reconstruction of the object from a diffraction pattern, measuring the disorder in liquids with high spatial and temporal resolution. The 20th century was dedicated to the development and improvement of synchrotron light sources with an ever ongoing increase of brilliance. With ultrahigh brilliance sources, the 21st century will be the century of x-ray lasers and their applications. Thus, we are already close to the dream of condensed matter and biophysics: imaging single (macro)molecules and measuring their dynamics on the femtosecond timescale to produce movies with atomic resolution.
