**Concurrent Computations** Stuart K. Tewksbury, Bradley Dickinson, Stuart C. Schwartz. 2012-12-06 The 1987 Princeton Workshop on Algorithm, Architecture and Technology Issues for Models of Concurrent Computation was organized as an interdisciplinary workshop emphasizing current research directions toward concurrent computing systems. With participants from several different fields of specialization, the workshop covered a wide variety of topics, though by no means a complete cross section of issues in this rapidly moving field. The papers included in this book were prepared for the workshop and, taken together, provide a view of the broad range of issues and alternative directions being explored. To organize the various papers, the book has been divided into five parts. Part I considers new technology directions. Part II emphasizes underlying theoretical issues. Communication issues, which are addressed in the majority of papers, are specifically highlighted in Part III. Part IV includes papers stressing the fault tolerance and reliability of systems. Finally, Part V includes systems-oriented papers, where the system ranges from VLSI circuits through powerful parallel computers. Much of the initial planning of the workshop was completed through an informal AT&T Bell Laboratories group consisting of Mehdi Hatamian, Vijay Kumar, Adrian Ligtenberg, Sailesh Rao, P. Subrahmanyam and myself. We are grateful to Stuart Schwartz, both for the support of Princeton University and for his organizing local arrangements for the workshop, and to the members of the organizing committee, whose recommendations for participants and discussion topics were particularly helpful. A. Rosenberg, and A. T.

**Sustainable Logistics** Wolf-Rüdiger Bretzke, Karim Barkawi. 2012-12-14 Currently the notion of sustainability is used in an inflationary manner. Therefore the authors start with a definition which is stable to serve as an anchor for further research as well as for discussions among scientists, managers and politicians, ideally across different disciplines. The character of this book is purely conceptual. The argumentation is based on comparison of new and demanding requisites with existing models (process and network architectures in the field of logistics). Formerly neglected impacts on the environment will be included. Main features of a new approach will be developed which are capable to avoid these impacts and to align logistics with the requirements of sustainability. In order to make logistics sustainable large parts will have to be reinvented. The focus needs to be on decoupling transportation activities from economic growth rates.

The 42 revised full papers and 20 revised short papers presented were carefully reviewed and selected from numerous submissions for inclusion in the book. The papers focus on research in embedded, reactive systems involving the interplay between symbolic/switching and continuous dynamical behaviors and feature the latest developments of applications and theoretical advancements in the design, analysis, control, optimization, and implementation of hybrid systems, with particular attention to embedded and networked control systems.

**Formal Modeling and Analysis of Timed Systems** Krishnendu Chatterjee, Thomas A. Henzinger. 2010-09-07 This volume contains the papers that were presented at the 8th International Conference on Formal Modeling and Analysis of Timed Systems (FORMATS 2010), held September 8-10, 2010, at IST (Institute of Science and Technology) Austria, in Klosterneuburg, Austria. The modeling and analysis of timing aspects of systems is a key problem that has been treated independently in several different communities in computer science and related areas. Researchers interested in semantics, verification, re-timing, and performance analysis study models such as timed automata and timed Petri nets, the digital design community focuses on propagation and switching delays, and designers of embedded controllers need to take into account the time required by controllers to compute their responses after sampling the environment. Although the timing-related questions in these separate communities have their own specific nature, there is a growing awareness that there are basic problems that are common to all of them. In particular, all of these disciplines model and analyze systems whose behavior depends on combinations of logical and timing constraints between occurrences of events. The aim of FORMATS is to promote the study of fundamental and practical aspects of timed systems, and to bring together researchers from different disciplines that share an interest in the modeling and analysis of timed systems. Typical topics include (but are not limited to): - Foundations and Semantics: theoretical foundations of timed systems and languages; comparison between different models (timed automata, timed Petri nets, hybrid automata, timed process algebra, max-plus algebra, probabilistic models).
