Rate Analysis Civil Swamy Rk.2019-07-18 In order to determine the rate of a particular item, the factors affecting the rate of that item are studied carefully and then finally a rate is decided for that item. This process of determining the rates of an item is termed as analysis of rates or rate analysis. The rate of particular item of work depends on the following: 1. Specifications of works and material about their quality, proportion and constructional operation method. 2. Quantity of materials and their costs. 3. Cost of labours and their wages. 4. Location of site of work and the distances from source and conveyance charges. 5. Overhead and establishment charges. 6. Profit. Cost of materials at source and at site of construction: The costs of materials are taken as delivered at site inclusive of the transport local taxes and other charges. Purpose of Analysis of rates: 1. To work out the actual cost of per unit of the items. 2. To work out the economical use of materials and processes in completing the particulars item. 3. To work out the cost of extra items which are not provided in the contract bond, but are to be done as per the directions of the department. 4. To revise the schedule of rates due to increase in the cost of material and labour or due to change in technique. Cost of labour - types of labour, standard schedule of rates: The labour can be classified in to 1) Skilled - 1st class 2) Skilled - 2d Class 3) Unskilled. The labour charges can be obtained from the standard schedule of rates 30% of the skilled labour provided in the data may be taken as Ist class, remaining 70% as II class. The rates of materials for Government works are fixed by the superintendent Engineer for his circle every year and approved by the Board of Chief Engineers. These rates are incorporated in the standard schedule of rates. Lead statement: The distance between the source of availability of material and construction site is known as Lead and is expected in Km. The cost of conveyance of material depends on lead. This statement will give the total cost of materials per unit item. It includes first cost, conveyance loading, unloading stacking, charges etc. The rate shown in the lead statement are for metalled road and include loading and staking charges. The environment lead on the metalled roads are arrived by multiplying by a factor. a) For metal tracks - Lead x 1.0 b) For cartze tracks - Lead x 1.1 c) For Sandy tracks - Lead x 1.4 Every construction project is divided into number of activities. Each activity consists of different types of civil or construction works. For example, the in the construction of a building, the activities can be excavation or earthwork, Concrete work, masonry work, Wood work such as doors and windows, plumbing, flooring, waterproofing, finishing work such as

plastering, painting and distempering. The Activity earthwork can be divided into many types based on depth and type of soil. For example, an excavation of 1.5m deep in soft soil, an excavation of 3m deep in hard soil. Likewise, concrete work can be divided into many types based on its mix proportions and its placement. For example, M25 reinforced concrete work in foundation, M30 reinforced concrete work in columns, slabs etc. Likewise, there can be many small civil works in every construction project. The cost of any construction project is calculated based on each work associated with every construction activity. Thus it is essential to calculate cost of each small work. Rate analysis of Civil Works or Building Works is the determination of cost of each construction work per unit quantity. This cost includes the cost of material

Proceedings of the 2023 5th International Conference on Structural Seismic and Civil Engineering Research (ICSSCER 2023) Zakiah Ahmad, Amit Srivastava, Sudharshan N. Raman. 2024-01-08 This is an open access book. As society progresses and the city scale increases, architecture is diversifying and becoming complex, with structures transforming from simple structures into high-rise, long-span and even special and complex structures. Architecture is where people live and work, so its security must be ensured. However, the architectural structure is likely to be destroyed by natural disasters (earthquakes, wind, snow, rain), man-made faults and incidents (explosion, fire, crashes) and accidental events like attacks and man-made sabotage in recent years. Therefore, countries have endeavored to improve architectural security for many years. A large number of anti-seismic issues in the civil engineering construction have turned up, which also gave birth to many new anti-seismic theories, technologies and

products. 2023 5th International Conference on Structural Seismic and Civil Engineering Research (ICSSCER 2023) will be held on August 25-27, 2023 in Nanjing, Jiangsu, China. With a display of the latest research outcomes in theoretical research, experimental study and engineering application, this conference creates a platform for scholars, researchers and technical personnel to exchange ideas and further understand each other. We extend a warm welcome to you and expect you to attend this academic feast to promote academic exchanges of relevant issues and advance the development of structural anti-seismic and civil engineering research and application. 2023 8th International Conference on Ecological Building and Green Building Material (EBGBM 2023, <http://www.ebgbm.net/>) will be conducted as a sub session of ICSSCER 2023. Scholars from home and abroad are welcomed to contribute papers and attend the conference.

Estimating for Building and Civil Engineering Works Spence Geddes.1976 It deals in a practical and reasonable way with many of the estimating problems which can arise where building and civil engineering works are carried out and to include comprehensive estimating data within the guidelines of good practice. The early part of the book has been completely rewritten to contain chapters useful to students and practitioners alike for the development of the estimating process resulting in the presentation of a tender for construction works. The second and major part of the book contains estimating data fully updated for the major elements in building and civil engineering work, including a new chapter on piling, and a wealth of constants for practical use in estimating. The estimating examples are based on the current edition of the Standard Method of Measurement for Building Works (SMM7). The comprehensive information on basic principles of estimating found in 'Spence Geddes' are still as valid today as the first edition. In this edition the prevailing rates of labour and costs of materials are taken whenever possible as a round figure. Readers will appreciate in the construction industry that prices are continually changing, rise and fall, and that worked examples should therefore be used as a guide to method of calculation substituting in any specific case the current rates applicable to it. In the case of plant output dramatic increases have been experienced in productivity over recent years and again estimators with their own records should substitute values appropriate to their work. Comprehensive treatise on estimating Unique wealth of estimating data Fully updated based on SMM7

Statistics and Probability for Engineering Applications William DeCoursey.2003-05-14 Statistics and Probability for Engineering Applications provides a complete discussion of all the major topics typically covered in a college engineering statistics course. This textbook minimizes the derivations and mathematical theory, focusing instead on the information and techniques most needed and used in engineering applications. It is filled with practical techniques directly applicable on the job. Written by an experienced industry engineer and statistics professor, this book makes learning statistical methods easier for today's student. This book can be read sequentially like a normal textbook, but it is designed to be used as a handbook, pointing the reader to the topics and sections pertinent to a particular type of statistical problem. Each new concept is clearly and briefly described, whenever possible by relating it to previous topics. Then the student is given carefully chosen examples to deepen understanding of the basic ideas and how they are applied in engineering. The examples and case studies are taken from real-world engineering problems and use real data. A number of practice problems are provided for each section, with answers in the back for selected problems. This book will appeal to engineers in the entire engineering spectrum (electronics/electrical, mechanical, chemical, and civil engineering); engineering students and students taking computer science/computer engineering graduate courses; scientists needing to use applied statistical methods; and engineering technicians and technologists. * Filled with practical techniques directly applicable on the job * Contains hundreds of solved problems and case studies, using real data sets * Avoids unnecessary theory

given by RICS NRM 1 & 2. As in previous editions the focus remains a logical approach the detailed measurement of building elements and copious use of examples to guide the student. The text has been fully revised in line with the NRM guidance and includes many new and revised examples illustrating the use of NRM. The hallmarks of previous editions - clarity and practicality - are maintained, while ensuring the book is fully up to date, providing the student of quantity surveying with a first class introduction to the measurement of building elements.

Piping and Pipeline Calculations Manual Philip Ellenberger.2014-01-22 Piping and Pipeline Calculations Manual, Second Edition provides engineers and designers with a quick reference guide to calculations, codes, and standards applicable to piping systems. The book considers in one handy reference the multitude of pipes, flanges, supports, gaskets, bolts, valves, strainers, flexibles, and expansion joints that make up these often complex systems. It uses hundreds of calculations and examples based on the author's 40 years of experiences as both an engineer and instructor. Each example demonstrates how the code and standard has been correctly and incorrectly applied. Aside from advising on the intent of codes and standards, the book provides advice on compliance. Readers will come away with a clear understanding of how piping systems fail and what the code requires the designer, manufacturer, fabricator, supplier, erector, examiner, inspector, and owner to do to prevent such failures. The book enhances participants' understanding and application of the spirit of the code or standard and form a plan for compliance. The book covers American Water Works Association standards where they are applicable. Updates to major codes and standards such as ASME B31.1 and B31.12 New methods for calculating stress intensification factor (SIF) and seismic activities Risk-based analysis based on API 579, and B31-G Covers the Pipeline Safety Act and the creation of PhMSA

Chances and Risks in Construction Management and Economics Christian Hofstadler,Markus Kummer.2021-06-20 The book outlines the processes of calculating and critically reviewing construction costs and times for clients and contractors in different project phases. Any project or structural analysis should yield accurate information on times, costs, and prices. The related database is more or less uncertain depending on project complexity and the circumstances of work performance. It is thus recommended to use ranges of key input parameters. This approach consistently considers uncertainties within a holistic project view, thus enhancing the plausibility and validity of specific values. Only the integration of probabilistic methods will allow for calculating and graphically representing the chance/risk ratio as a crucial project variable ultimately influencing the entire business. This book examines the systemic modeling and consideration of uncertainties when determining construction costs and times, and life-cycle costs. It contains detailed descriptions of other decision-making processes, including project preparation and planning (developer calculation, soil survey, cost estimate), work preparation (costing, pricing, construction time evaluation, resource identification, comparison of construction methods, bid analysis, contract award), and project execution (site logistics, construction method selection, construction process planning, work coordination, sourcing, determination of additional costs, trend analyses), as well as for project portfolio management as a tool relevant to all phases.
