Industrial Solid Wastes A. D. Patwardhan.2013-01-01 Industrial solid wastes, unlike liquid effluents and gaseous emissions, receive relatively less attention in terms of treatment, reuse, recycle, and recovery of useful by-products. These solid wastes have great potential for recovery and reuse. Predominantly organic wastes can be effectively treated by biological means to yield useful end products like methane gas as fuel and digested slurry

as soil conditioner. Inert materials like plastics are effectively blended with other building materials, thereby improving the quality of the finished product and at least partially solving the problem of disposal of plastics. Inorganic wastes are excellent candidates for recovery of reusable building materials like sand and fine aggregate. Recycling of useful components from e-wastes goes a long way in reducing environmental pollution by toxic and hazardous wastes. This book places before the reader different ways and means used by scientists and engineers to minimize pollution of our natural resources and their overexploitation.

Pipeline Route Selection for Rural and Cross Country Pipelines Nicholas B. Day.1998-01-01 This 1998 version of Manual No. 46, Pipeline Route Selection for Rural and Cross-Country Pipelines, replaces Report on Pipeline Location, published in 1965. Since that time, many high technology items have been developed to benefit the Routing Engineer, the Project Manager, and other project team members. In addition to technological developments, this updated manual places much more emphasis on environmental, regulatory, and political issues related to pipeline route selection.

Climate-Resilient Infrastructure Committee on Adaptation to a Changing Climate.2018 Abstract: Prepared by the Committee on Adaptation to a Changing Climate of ASCE Civil infrastructure systems traditionally have been designed for appropriate functionality, durability, and safety for climate and weather extremes during their full-service lives; however, climate scientists inform us that the extremes of climate and weather have altered from historical values in ways difficult to predict or project. *Climate-Resilient Infrastructure: Adaptive Design and Risk Management, MOP 140*, provides guidance for and contributes to the developing or enhancing of methods for infrastructure analysis and design in a world in which risk profiles are changing and can be projected with varying degrees of uncertainty requiring a new design philosophy to meet this challenge. The underlying approaches in this manual of practice (MOP) are based on probabilistic methods for quantitative risk analysis, and the design framework provided focuses on identifying and analyzing low-regret, adaptive strategies to make a project more resilient. Beginning with an overview of the driving forces and hazards associated with a changing climate, subsequent chapters in MOP 140 provide observational methods, illustrative examples, and case studies; estimation of extreme events particularly related to precipitation with guidance on monitoring and measuring methods; flood design criteria and the development of project design flood elevations; computational methods of determining flood loads; adaptive design and adaptive risk management in the context of life-cycle engineering and economics; and climate resilience technologies. MOP 140 will be of interest to engineers, researchers, planners, and other stakeholders charged with adaptive design decisions to achieve infrastructure resilience targets while minimizing life-cycle costs in a changing climate
