Women and Power at the French Court, 1483-1563 Susan Broomhall.2018 Women and Power at the French Court, 1483--1563 explores the ways in which a range of women as consorts, regents, mistresses, factional power players, attendants at court, or as objects of courtly patronage wielded power in order to advance individual, familial, and factional agendas at the early sixteenth-century French court. Spring-boarding from the burgeoning scholarship of gender, the political, and power in early modern Europe, the collection provides a perspective from the French court, from the reigns of Charles VIII to Henri II, a time when the French court was a renowned center of culture and at which women played important roles. Crossdisciplinary in its perspectives, these essays by historians, art and literary scholars investigate the dynamic operations of gendered power in political acts, recognized status as queens and regents, ritualized behaviors such as gift-giving, educational coteries, and through social networking, literary and artistic patronage, female authorship, and epistolary strategies.

In Memoriam Paul-André Meyer - Séminaire de Probabilités XXXIX Marc Yor,Michel Émery.2006-10-17 The 39th volume of Séminaire de Probabilités is a tribute to the memory of Paul André Meyer. His life and achievements are recalled in this book, and tributes are paid by his friends and colleagues. This volume also contains mathematical contributions to classical and quantum stochastic calculus, the theory of processes, martingales and their applications to mathematical finance and Brownian motion. These contributions provide an overview on the current trends of stochastic calculus.

From Holomorphic Functions to Complex Manifolds Klaus Fritzsche,Hans Grauert.2012-12-06 This introduction to the theory of complex manifolds covers the most important branches and methods in complex analysis of several variables while completely avoiding abstract concepts involving sheaves, coherence, and higher-dimensional cohomology. Only elementary methods such as power series, holomorphic vector bundles, and one-dimensional cocycles are used. Each chapter contains a variety of examples and exercises.

Historia Gianna Pomata,Nancy G. Siraisi.2005 Essays examine how the genre of historia reflects connections between the study of nature and the study of culture in early modern scholarly pursuits. The early modern genre of historia connected the study of nature and the study of culture from the early Renaissance to the eighteenth century. The ubiquity of historia as a descriptive method across a variety of disciplines--including natural history, medicine, antiquarianism, and philology--indicates how closely intertwined these scholarly pursuits were in the early modern period. The essays collected in this volume demonstrate that historia can be considered a key epistemic tool of early modern intellectual practices. Focusing on the actual use of historia across disciplines, the essays highlight a distinctive feature of early modern descriptive sciences: the coupling of observational skills with philological learning, empiricism with erudition. Thus the essays bring to light previously unexamined links between the

culture of humanism and the scientific revolution. The contributors, from a range of disciplines that echoes the broad scope of early modern historia, examine such topics as the development of a new interest in historical method from the Renaissance artes historicae to the eighteenth-century tension between history and system; shifts in Aristotelian thought paving the way for reevaluation of historia as descriptive knowledge; the rise of the new discipline of natural history; the uses of historia in anatomical and medical investigation and the writing of history by physicians; parallels between the practices of collecting and presenting information in both natural history and antiquarianism; and significant examples of the ease with which early seventeenth-century antiquarian scholars moved from studies of nature to studies of culture.

Thomas Harriot's Doctrine of Triangular Numbers Janet Beery, Jacqueline A. Stedall.2009 Thomas Harriot (1560-1621) was a mathematician and astronomer who founded the English school of algebra. He is known not only for his work in algebra and geometry but also as a prolific writer with wide-ranging interests in ballistics, navigation, and optics. (He discovered the sine law of refraction now known as Snell's law.) By about 1614, Harriot had developed finite difference interpolation methods for navigational tables. In 1618 (or slightly later) he composed a treatise entitled 'De numeris triangularibus et inde de progressionibus arithmetis, Magisteria magna', in which he derived symbolic interpolation formulae and showed how to use them. This treatise was never published and is here reproduced for the first time. Commentary has been added to help the reader follow Harriot's beautiful but almost completely nonverbal presentation. The introductory essay preceding the treatise gives an overview of the contents of the 'Magisteria' and describes its influence on Harriot's contemporaries and successors over the next sixty years. Harriot's method was not superseded until Newton, apparently independently, made a similar discovery in the 1660s. The ideas in the 'Magisteria' were spread primarily through personal communication and unpublished manuscripts, and so, quite apart from their intrinsic mathematical interest, their survival in England during the seventeenth century provides an important case study in the dissemination of mathematics through informal networks of friends and acquaintances.

Mathematical Problem Solving ALAN H. SCHOENFELD.2014-06-28 This book is addressed to people with research interests in the nature of mathematical thinking at any level, to people with an interest in higher-order thinking skills in any domain, and to all mathematics teachers. The focal point of the book is a framework for the analysis of complex problem-solving behavior. That framework is presented in Part One, which consists of Chapters 1 through 5. It describes four qualitatively different aspects of complex intellectual activity: cognitive resources, the body of facts and procedures at one's disposal; heuristics, rules of thumb for making progress in difficult situations; control, having to do with the efficiency with which individuals utilize the knowledge at their disposal; and belief systems, one's perspectives regarding the nature of a discipline and how one goes about working in it. Part Two of the book, consisting of Chapters 6 through 10, presents a series of empirical studies that flesh out the analytical framework. These studies document the ways that competent problem solvers make the most of the knowledge at their disposal. They include observations of students, indicating some typical roadblocks to success. Data taken from students before and after a series of intensive problem-solving courses document the kinds of learning that can result from carefully designed instruction. Finally, observations made in typical high school classrooms serve to indicate some of the sources of students' (often counterproductive) mathematical behavior.

Symbolizing, Modeling and Tool Use in Mathematics Education K.P Gravemeijer, R. Lehrer, H.J. van Oers, Lieven Verschaffel. 2013-03-09 This book explores the option of building on symbolizing, modeling and tool use as personally meaningful activities of students. It discusses the dimension of setting: varying from the study of informal, spontaneous activity of students, to an explicit focus on instructional design, and goals and effects of instruction; and the dimension of the theoretical framework of the researcher: varying from constructivism, to activity theory, cognitive psychology and instructional-design theory.

Mathematical Logic H.-D. Ebbinghaus, J. Flum, Wolfgang Thomas. 2013-03-14 This introduction to first-order logic clearly works out the role of first-order logic in the foundations of mathematics, particularly the two basic questions of the range of the axiomatic method and of theorem-proving by machines. It covers several advanced topics not commonly treated in introductory texts, such as Fraïssé's characterization of elementary equivalence, Lindström's theorem on the maximality of first-order logic, and the fundamentals of logic programming.

From Cardano's Great Art to Lagrange's Reflections Jacqueline A. Stedall. 2011 This book is an exploration of a claim made by Lagrange in the autumn of 1771 as he embarked upon his lengthy "Reflexions sur la resolution algebrique des equations": that there had been few advances in the algebraic solution of equations since the time of Cardano in the mid sixteenth century. That opinion has been shared by many later historians. The present study attempts to redress that view and to examine the intertwined developments in the theory of equations from Cardano to Lagrange. A similar historical exploration led Lagrange himself to insights that were to transform the entire nature and scope of algebra. Progress was not confined to any one country: at different times mathematicians in Italy, France, the Netherlands, England, Scotland, Russia, and Germany contributed to the discussion and to a gradual deepening of understanding. In particular, the national Academies of Berlin, St. Petersburg, and Paris in the eighteenth century were crucial in supporting informed mathematical communities and encouraging the wider dissemination of key ideas. This study therefore truly highlights the existence of a European mathematical heritage. The book is written in three parts. Part I offers an overview of the period from Cardano to Newton (1545 to 1707) and is arranged chronologically. Part II covers the period from Newton to Lagrange (1707 to 1771) and treats the material according to key themes. Part III is a brief account of the aftermath of the discoveries made in the 1770s. The book attempts throughout to capture the reality of mathematical discovery by inviting the reader to follow in the footsteps of the authors themselves, with as few changes as possible to the original notation and style of presentation.

Georges Lemaître: Life, Science and Legacy Rodney D. Holder, Simon Mitton. 2013-01-13 The year 2011 marked the 80th anniversary of Georges Lemaître's primeval atom model of the universe, forerunner of the modern day Big Bang theory. Prompted by this momentous anniversary the Royal Astronomical Society decided to publish a volume of essays on the life, work and faith of this great cosmologist, who was also a Roman Catholic priest. The papers presented in this book examine in detail the historical, cosmological, philosophical and theological issues surrounding the development of the Big Bang theory from its beginnings in the pioneering work of Lemaître through to the modern day. This book offers the best account in English of Lemaître's life and work. It will be appreciated by professionals and graduate students interested in the history of cosmology.

Task Design In Mathematics Education Anne Watson, Minoru Ohtani. 2015-10-26 *THIS BOOK IS AVAILABLE AS OPEN ACCESS BOOK ON SPRINGERLINK* This open access book is the product of ICMI Study 22 Task Design in Mathematics Education. The study offers a state-of-the-art summary of relevant research and goes beyond that to develop new insights and new areas of knowledge and study about task design. The authors

represent a wide range of countries and cultures and are leading researchers, teachers and designers. In particular, the authors develop explicit understandings of the opportunities and difficulties involved in designing and implementing tasks and of the interfaces between the teaching, researching and designing roles - recognising that these might be undertaken by the same person or by completely separate teams. Tasks generate the activity through which learners meet mathematical concepts, ideas, strategies and learn to use and develop mathematical thinking and modes of enquiry. Teaching includes the selection, modification, design, sequencing, installation, observation and evaluation of tasks. The book illustrates how task design is core to effective teaching, whether the task is a complex, extended, investigation or a small part of a lesson; whether it is part of a curriculum system, such as a textbook, or promotes free standing activity; whether the task comes from published source or is devised by the teacher or the student.

Evariste Galois 1811-1832 Laura Toti Rigatelli.2012-12-06 Evariste Galois' short life was lived against the turbulent background of the restoration of the Bourbons to the throne of France, the 1830 revolution in Paris and the accession of Louis-Phillipe. This new and scrupulously researched biography of the founder of modern algebra sheds much light on a life led with great intensity and a death met tragically under dark circumstances. Sorting speculation from documented fact, it offers the fullest and most exacting account ever written of Galois' life and work. It took more than seventy years to fully understand the French mathematician's first mémoire (published in 1846) which formulated the famous Galois theory concerning the solvability of algebraic equations by radicals, from which group theory would follow. Obscurities in his other writings - mémoires and numerous fragments of extant papers - persist and his ideas challenge mathematicians to this day. Thus scholars will welcome those chapters devoted specifically to explicating all aspects of Galois' work. A comprehensive bibliography enumerates studies by and also those about the mathematician.

Indigenous and Decolonizing Studies in Education Linda Tuhiwai Smith,Eve Tuck,K. Wayne Yang.2018-06-14 Indigenous and decolonizing perspectives on education have long persisted alongside colonial models of education, yet too often have been subsumed within the fields of multiculturalism, critical race theory, and progressive education. Timely and compelling, Indigenous and Decolonizing Studies in Education features

research, theory, and dynamic foundational readings for educators and educational researchers who are looking for possibilities beyond the limits of liberal democratic schooling. Featuring original chapters by authors at the forefront of theorizing, practice, research, and activism, this volume helps define and imagine the exciting interstices between Indigenous and decolonizing studies and education. Each chapter forwards Indigenous principles - such as Land as literacy and water as life - that are grounded in place-specific efforts of creating Indigenous universities and schools, community organizing and social movements, trans and Two Spirit practices, refusals of state policies, and land-based and water-based pedagogies.

Pangeometry Nikolai Ivanovich Lobachevskii. 2010 Lobachevsky wrote Pangeometry in 1855, the year before his death. This memoir is a resume of his work on non-Euclidean geometry and its applications and can be considered his clearest account on the subject. It is also the conclusion of his life's work and the last attempt he made to acquire recognition. The treatise contains basic ideas of hyperbolic geometry, including the trigonometric formulae, the techniques of computation of arc length, of area and of volume, with concrete examples. It also deals with the applications of hyperbolic geometry to the computation of new definite integrals. The techniques are different from those found in most modern books on hyperbolic geometry since they do not use models. Besides its historical importance, Lobachevsky's Pangeometry is a beautiful work, written in a simple and condensed style. The material that it contains is still very alive, and reading this book will be most useful for researchers and for students in geometry and in the history of science. It can be used as a textbook, as a sourcebook, and as a repository of inspiration. The present edition provides the first complete English translation of Pangeometry available in print. It contains facsimiles of both the Russian and the French original versions. The translation is accompanied by notes, followed by a biography of Lobachevsky and an extensive commentary.

The Colonial System Unveiled Baron De Vastey. 2016-01-25 Long neglected in mainstream history books, the Haitian Revolution (1791-1804) is now being claimed across a range of academic disciplines as an event of world-historical importance. The former slaves' victory over their French masters and the creation of the independent nation of Haiti in 1804 is being newly heralded not only as a seminal moment in the transnational formation of

the 'black Atlantic' but as the most far-reaching manifestation of 'Radical Enlightenment'. The best known Haitian writer to emerge in the years after the revolution is Baron de Vastey (1781-1820), who authored over ten books and pamphlets between 1814 and his murder in 1820. His first and most incendiary work, *Le système colonial dévoilé* (1814), provides a moving invocation of the horrors of slavery in pre-revolutionary Saint-Domingue. Its trailblazing critique of colonialism anticipates by over a hundred years the anticolonial politics (and poetics) of Césaire, Fanon, and Sartre.

Translated here for the first time, Vastey's forceful unveiling of the colonial system will be compulsory reading for scholars across the humanities.

The Mathematical Writings of Évariste Galois Évariste Galois, Peter M. Neumann. 2011 Before he died at the age of twenty, shot in a mysterious early-morning duel at the end of May 1832, Evariste Galois created mathematics that changed the direction of algebra. This book contains English translations of almost all the Galois material. The translations are presented alongside a new transcription of the original French and are enhanced by three levels of commentary. An introduction explains the context of Galois' work, the various publications in which it appears, and the vagaries of his manuscripts. Then there is a chapter in which the five mathematical articles published in his lifetime are reprinted. After that come the testamentary letter and the first memoir (in which Galois expounded on the ideas that led to Galois Theory), which are the most famous of the manuscripts. These are followed by the second memoir and other lesser known manuscripts. This book makes available to a wide mathematical and historical readership some of the most exciting mathematics of the first half of the nineteenth century, presented in its original form. The primary aim is to establish a text of what Galois wrote. The details of what he did, the proper evidence of his genius, deserve to be well understood and appreciated by mathematicians as well as historians of mathematics.
