Eliza Hamilton Dunlop Katie Hansord, Jason Rudy, Stuart Gibson, Dr Peter Minter, Dr Graeme Skinner, Dr James Wafer, Professor Duncan Wu. 2021-05-01 Eliza Hamilton Dunlop (1796-1880) arrived in Sydney in 1838 and became almost immediately notorious for her poem "The Aboriginal Mother," written in response to the infamous Myall Creek massacre. She published more poetry in colonial newspapers during her lifetime, but for the century following her death her work was largely neglected. In recent years, however, critical interest in Dunlop has increased, in Australia and internationally and in a range of fields, including literary studies; settler, postcolonial and imperial studies; and Indigenous studies. This stimulating collection of essays by leading scholars considers Dunlop's work from a range of perspectives and includes a new selection of her poetry.

Common Core Curriculum Maps in English Language Arts, Grades K-5 Great Minds. 2011-10-19 The first books to present specific guidance for teaching the Common Core State Standards Forty-three states plus the District of Columbia and the U.S. Virgin Islands have signed on to adopt the Common Core State Standards (CCSS). The need for curriculum guides to assist teachers in helping students meet these standards has become imperative. Created by teachers, for teachers, the research-based curriculum maps in this book present a comprehensive, coherent sequence of thematic units for teaching the skills outlined in the CCSS for English language arts in Grades K-5. The maps address every standard in the CCSS, yet are flexible and adaptable to accommodate diverse teaching styles. Each grade is broken down into six units that include focus standards, suggested works, sample activities and assessments, lesson plans, and more Teachers can use the maps to plan their year and craft their own more detailed lesson plans Any teacher, school, or district that chooses to follow the Common Core maps can be confident that they are adhering to the standards.

The Origins of the Telescope Albert Van Helden, Sven Dupré, Rob van Gent. 2010 The origins of the telescope have been discussed and debated since shortly after the instrument's appearance in The Hague in 1608. Civic and national pride have led local dignitaries, popular writers, and numerous scholars to search the archives and to construct sharply divergent histories. Did the honor of the invention belong to the Dutch, to the Italians, to the English, or to the Spanish? And if the city of Middelburg in the Netherlands was, in fact, the cradle of the instrument, was the true inventor Hans Lipperhey or his rival Zacharias Jansen? Or was the instrument there before anyone knew it? Over the past several decades, a group of historians and scientists have sought out new documents, re-examined familiar ones, and tested early lenses and telescopes. This volume contains the proceedings of a symposium held in Middelburg in September 2008 to mark 400 years of the telescope. The essays in it, taken as a whole, present a new and convincing account of the origins of the instrument that changed mankind's vision of the universe.

Images of the Universe Carole Stott. 1991-11-21 Images of the Universe is a special collection of essays written to celebrate astronomy and the centenary of the British Astronomical Association. Colin Ronan opens the book with a fascinating account of the developments over the last hundred years. For the first time in history astronomers can detect radiation emanating from the Universe across the entire electromagnetic spectrum. Space probes have visited the planets and various missions have beamed back to Earth historically and scientifically important images, many of which appear in this book. Astronomy is a science where the amateur and the professional interact constructively. This book is a testament to this relationship. The work of amateurs is presented alongside that of the professional and in each chapter the future discoveries are anticipated. Each planet is explored and beautifully illustrated. The stars, birth place of the elements are examined. Paul Murdin, gives an account of the brightest supernova to be seen from earth since 1604. Iain Nicolson, explores G2 the single dwarf called the Sun. Heather Couper and Nigel Henbest look at the Milky Way, the hazy band of light that is the edge on view of our galaxy. Malcolm Longair looks beyond our own galaxy into the deep sky. Paul Davies gives an account of the first one second of the existence of our expanding Universe. How did it all happen? Martin Rees, the cosmologist, speculates on the origin of the Universe.

A Brave New World of Knowledge B. J. Sokol.2003 This study of an extraordinary work of dramatic literature also addresses questions of the nature and dissemination of the scientific revolution. These facets are locked together: although the book does not deny that 'The Tempest' had deep roots in classical literature and elsewhere, it maintains that the play's remarkable dramaturgy and symbolism reflect subtle matters uniquely pertinent to its own fascinating time. A 'Brave New World of Knowledge' uncovers a number of previously little-appreciated connections of 'The Tempest' with specific problems or advances of knowledge, thus showing that the play reflected innovative proto-scientific modes of confronting the physical, biological, and human realms. It also argues that Shakespeare's play mirrored a new tendency to repudiate earlier Renaissance dreams of achieving omniscience and omnipotence. The play reflected a newer hope for knowledge based on speculative boldness linked with close observation, rational and sober precision, and a radical capacity to accept limitation and not-knowing.

Science and Civilisation in China: Volume 7, The Social Background, Part 2, General Conclusions and Reflections Joseph Needham.2004-07-22 It would be difficult to overstate the importance of Joseph Needham's *Science and Civilisation in China* series. For nearly fifty years, Needham and his collaborators have revealed the ideals, concepts and achievements of China's scientific and technological traditions from the earliest times to about 1800 through this great enterprise. During his long working lifetime, Needham kept in draft various essays, some written with collaborators, in which he set out his broad views on the Chinese social and historical context. These essays, edited by one of his closest collaborators, Kenneth Robinson, are contained in the present volume. A reading of this material makes it possible to reconstruct the assumptions and problematics that underpinned and drove the Needham project throughout the nearly one half century during which he was at the helm. The documents gathered here reveal the intellectual foundations of one of the greatest scholarly enterprises of the twentieth century.

Chronicling the Golden Age of Astronomy Neil English.2018-10-31 The invention of the telescope at the dawning of the 17th century has revolutionized humanity's understanding of the Universe and our place within it. This book traces the development of the telescope over four centuries, as well as the many personalities who used it to uncover brand-new revelations about the Sun, Moon, planets, stars and distant galaxies. Starting with early observers such as Thomas Harriot, Galileo, Johannes Hevelius, Giovanni Domenico Cassini, Robert Hooke and Christian Huygens, the book explores how these early observers arrived at essentially correct ideas concerning the objects they studied. Moving into the 18th and 19th centuries, the author describes the increasing sophistication of telescopes both large and small, and the celebrated figures who used them so productively, including the Herschels, Charles Messier, William Lassell and the Earls of Rosse. Many great discoveries were also made with smaller instruments when placed in the capable hands of the Struve dynasty, F.W. Bessel, Angelo Secchi and S.W Burnham, to name but a few. Nor were all great observers of professional ilk. The book explores the contributions made by the 'clerical astronomers,' William Rutter Dawes, Thomas William Webb, T.E.R Philips and T.H.E.C Espin, as well as the lonely vigils of E.E. Barnard, William F. Denning and Charles Grover. And in the 20th century, the work of Percival Lowell, Leslie Peltier, Eugene M. Antoniadi, Clyde Tombaugh, Walter Scott Houston, David H. Levy and Sir Patrick Moore is fully explored. Generously illustrated throughout, this treasure trove of astronomical history shows how each observer's work led to seminal developments in science, and providing key insights into how we go about exploring the heavens today.

Mathematical Practitioners and the Transformation of Natural Knowledge in Early Modern Europe Lesley B. Cormack, Steven A. Walton, John A. Schuster.2017-03-15 This book argues that we can only understand transformations of nature studies in the Scientific Revolution if we take seriously the interaction between practitioners (those who know by doing) and scholars (those who know by thinking). These are not in opposition, however. Theory and practice are end points on a continuum, with some participants interested only in the practical, others only in the theoretical, and most in the murky intellectual and material world in between. It is this borderland where influence, appropriation, and collaboration have the potential to lead to new methods, new subjects of enquiry, and new social structures of natural philosophy and science. The case for connection between theory and practice can be most persuasively drawn in the area of mathematics, which is the focus of this book. Practical mathematics was a growing field in early modern Europe and these essays are organised into three parts which contribute to the debate about the role of mathematical practice in the Scientific Revolution. First, they demonstrate the variability of the identity of practical mathematicians, and of the

practices involved in their activities in early modern Europe. Second, readers are invited to consider what practical mathematics looked like and that although practical mathematical knowledge was transmitted and circulated in a wide variety of ways, participants were able to recognize them all as practical mathematics. Third, the authors show how differences and nuances in practical mathematics typically depended on the different contexts in which it was practiced: social, cultural, political, and economic particularities matter. Historians of science, especially those interested in the Scientific Revolution period and the history of mathematics will find this book and its ground-breaking approach of particular interest.
