**The Ureter** H. Bergman. 2012-12-06 This volume, focusing on the ureter and the diseases which involve it, is an updated second edition. Many journals and textbooks deal with the physiology, pathology, diagnosis, and therapy of derangements of the urinary tract. In most instances, however, the discussion properly centers on the disease process itself and its primary aspects, with only a tangential description of effects on the ureter. The editor is therefore correct that the ureter itself should be considered a major organ. Though it has been regarded in the recent past as a simple muscular tube, reacting to stretching or filling by contraction, this simplistic view of ureteral physiology is changing fast. With expanded knowledge of ureteral physiology, a pharmacology is developing which is becoming useful to the clinician in many ways. One of the most interesting aspects of the ureter is its role in inducing the permanent kidney, the metanephros. Relatively slight displacements in the origin of the ureteral bud result in ectopic ureteral orifices and a wide range of congenital anomalies. An ureteral bud which arises medial to the normal position at the genu of the mesonephric duct results in a lateral, and usually incompetent, ureterovesical junction after the duct is taken up to form a portion of the trigone. This appears certainly to be the developmental

mechanism which results in primary reflux.

*Endourology* Culley C. Carson, N. Reed Dunnick. 1985

**Neural Control of Renal Function, Second Edition** Ulla C. Kopp. 2018-07-17 The kidney is innervated with efferent sympathetic nerve fibers reaching the renal vasculature, the tubules, the juxtaglomerular granular cells, and the renal pelvic wall. The renal sensory nerves are mainly found in the renal pelvic wall. Increases in efferent renal sympathetic nerve activity reduce renal blood flow and urinary sodium excretion by activation of  $\alpha_1$ -adrenoceptors and increase renin secretion rate by activation of  $\beta_1$ -adrenoceptors. In response to normal physiological stimulation, changes in efferent renal sympathetic nerve activity contribute importantly to homeostatic regulation of sodium and water balance. The renal mechanosensory nerves are activated by stretch of the renal pelvic tissue produced by increases in renal pelvic tissue of a magnitude that may occur during increased urine flow rate. Under normal conditions, the renal mechanosensory nerves activated by stretch of the sensory nerves elicits an inhibitory renorenal reflex response consisting of decreases in efferent renal sympathetic nerve activity leading to natriuresis. Increasing efferent sympathetic nerve activity increases afferent renal nerve activity which, in turn, decreases efferent renal sympathetic nerve activity by activation of the renorenal reflexes. Thus, activation of the afferent renal nerves

buffers changes in efferent renal sympathetic nerve activity in the overall goal of maintaining sodium balance. In pathological conditions of sodium retention, impairment of the inhibitory renorenal reflexes contributes to an inappropriately increased efferent renal sympathetic nerve activity in the presence of sodium retention. In states of renal disease or injury, there is a shift from inhibitory to excitatory reflexes originating in the kidney. Studies in essential hypertensive patients have shown that renal denervation results in long-term reduction in arterial pressure, suggesting an important role for the efferent and afferent renal nerves in hypertension.

Clinical Ultrasound Angela Creditt, Jordan Tozer, Michael Vitto, Michael Joyce, Lindsay Taylor. 2017-12-09 This pocket manual is designed to guide medical professionals in acquiring skills in basic ultrasound imaging. It describes the most common scans performed at the patient's bedside, specifically in the emergency department or intensive care unit. **Nutrition in Kidney Disease** Laura D. Byham-Gray, Jerrilynn D. Burrowes, Glenn M. Chertow. 2014-01-23 Nutrition in Kidney Disease, Second Edition addresses the relationships between nutrition and (1) normal kidney function and disease, (2) the progressiveness of chronic kidney disease (CKD) and strategies to prevent further compromise, and (3) the treatment and management of kidney failure especially during medical crises, such as acute kidney injury and its consequent nutritional therapies (e.g., enteral and parenteral nutrition). Demographic patterns, trends and outcomes in the current health care systems are explored in the United States and abroad. Disease prevention and management are presented over the entire lifespan, beginning with pregnancy, followed by infancy, childhood, adolescence, and adulthood, concluding with the elder years. Foundations for clinical practice are established by devoting a complete section towards conducting a comprehensive nutritional assessment, comprising of anthropometric, biochemical, clinical, physical parameters and psychosocial concerns unique to the kidney disease population.

Nutritional therapy is also discussed across the spectrum of kidney disease, and pertinent aspects critical to successful management of disorders and conditions, such as bone disease, obesity, and nephrotic syndrome are explored. Nutrition in Kidney Disease, Second edition highlights cutting edge research in regards to exercise and functional outcomes, malnutrition and the inflammatory response, experimental therapies, and the use of complementary and alternative medicine, with a special emphasis on relevant preventative strategies.

*Ultrastructure of the Kidney* Albert J. Dalton,Françoise Haguenu.2013-09-17 Ultrastructure in Biological Systems, Volume 2: Ultrastructure of the Kidney provides an overview of the state of knowledge on the ultrastructure of the mammalian kidney. The application of the electron

microscope to studies of the kidney resulted in the demonstration of the hitherto undetected early thickening of the basement membrane of glomerular capillaries in glomerulonephritis. Yet many problems remain, particularly in relation to the correlation between function and the ultrastructure of components of the kidney—mesangium, glomerulus, juxtaglomerular apparatus, and the renal tubules. It is only recently that the mesangium has come to be accepted as real, and many questions remain as to the function of its cells. The existence of true membranes between foot processes of the epithelial cells of glomeruli is a newly established fact; but what this has to do with glomerular filtration is not known at present. Granules apparently secretory in nature have been identified in cells of the juxtaglomerular apparatus, but so far their presence has not been correlated with specific functional change. Artifacts introduced at fixation are now known to have considerable relevance in interpreting the ultrastructure of the normal nephron. These are paraphrased views of the contributors to this monograph who, while acquainting the reader with the research being carried on in these areas, have also brought into focus the many problems still awaiting solution.

**Structural Analysis of the Rabbit Kidney** Brigitte Kaissling, W. Kriz. 1979-01-01 Karl Peter stated in 1909 in his famous monograph, *Untersuchungen über Bau und Entwicklung der Niere*, that the rabbit has a simply structured kidney and without knowledge of it he would not have succeeded in understanding the structural organization of other more complicated kidneys. Even with today's advanced knowledge of kidney organization this statement is still valid. With regard to the histotopographic relations of tubules and vessels as well as to the ultrastructure, the rabbit kidney is more simply organized than other mammalian kidneys, for example the mouse kidney and especially the *Psammomys* kidney. The rabbit kidney essentially displays the basic pattern of a mammalian kidney. Therefore, a thorough knowledge of the morphology of the rabbit kidney is indispensable for

investigating kidneys of other species. Another reason for extensively investigating the rabbit kidney is that it is the only kidney with tubules that can easily be isolated and, therefore, be used for in vitro experiments (Burg et al. , 1966). Many investigations using these techniques have been performed in the last decade (for references see corresponding chapters). Accordingly the different segments of the nephron are functionally best characterized in the rabbit kidney. The purpose of this paper is to supply the basis for good structural-functional correlations. 2 Material and Methods 2. 1 Light Microscopy The histologic and histotopographic observations are based on a study of the kidneys of a total of 25 male and female New Zealand rabbits (2500-4500 g body wt. ). . 2. 1.

**Living Kidney Donation** Krista L. Lentine, Beatrice P. Concepcion, Edgar V. Lerma. 2021-03-05 This book provides a complete guide to the evaluation, care, and follow-up of living kidney donors. Living donor kidney transplantation is established as the best treatment option for kidney failure. However, despite the tremendous benefits of living donation to recipients and society, the outcomes and optimal care of donors themselves have received relatively less attention. Fortunately, things are changing - including recent landmark developments in living donor risk assessment, policy and guidance. This volume offers authoritative, evidence-based guidance on the full range of clinical scenarios encountered in the evaluation and care of living kidney donors. The approach to key elements of risk assessment, ethical considerations and informed consent is accompanied by recommendations for patient-centered care before, during, and after donation. Advocacy initiatives and policies to remove disincentives to donation and advance a defensible system of practice are also discussed. General and transplant nephrologists, as well as related allied health professionals, can look to this book as a comprehensive resource addressing contemporary clinical topics in the practice of living kidney donation.

**The Vascular Pole of the Renal Glomerulus of Rat** Marlies Elger, Tatsuo Sakai, Wilhelm Kriz. 2013-03-08 Glomerular filtration represents one of the basic mechanisms in the function of an organism. Our understanding of this process is still quite fragmentary. Regulation of blood flow and pressure, together with regulation of the ultrafiltration coefficient (which is an attribute of the filtration barrier), are the two fundamental mechanisms accounting for maintenance and adaptability of glomerular filtration. Regulation of glomerular blood flow is generally considered to result from an interplay between afferent and efferent glomerular arterioles, and much progress has been made recently in understanding this interplay (Navar et al. 1996). The present study provides a detailed structural description of the glomerular vascular pole of rat. The results of this study appear to be relevant for several open questions of glomerular function. First, the interaction between afferent and efferent arterioles in regulating glomerular blood is generally understood to occur between the preglomerular and the postglomerular portions of these vessels. As shown in the present study, the structural elaborations of these arterioles and the spatial relationships between them within the glomerular hilum strongly suggest an interplay also at this site. Moreover, the current understanding of glomerular blood flow regulation by tuning the interplay between afferent and efferent arterioles is exclusively based on signals whose regulatory loops are established in follow-up events outside the glomerulus (tubuloglomerular balance, tubuloglomerular feedback).
