Neurological Rehabilitation, 2e Janet H. Carr,Roberta B. Shepherd.2011-07-06 Janet Carr and Roberta Shepherd head up a new team of eminent authors for the second edition of this definitive text on neurological physiotherapy. In the first edition, the authors described a model of neurological rehabilitation for individuals with motor dysfunction based on scientific research in the areas of neuromuscular control, biomechanics, motor skill learning, and the link between cognition and action, together with developments in pathology and adaptation. The new edition continues to advance this model while identifying and incorporating the many advances that have occurred in the last decade in the understanding and treatment of adults with neurological conditions, whether caused by accident or disease. Among these advances is the knowledge that the brain retains a plastic potential to reorganize, even in old and/or lesioned brains, and that neural plasticity can be influenced by task-related mental and physical practice in a stimulating environment. There is also an increasing body of knowledge related to the musculoskeletal system's adaptability and the need to prevent length and stiffness- related changes in muscle contractility, together with loss of aerobic fitness and endurance. There is an expanding body of clinical research that appears to support the model provided here. The training guidelines outlined in Neurological Rehabilitation are based on biomechanical constructs and motor relearning research, applied to enhance brain reorganization and muscle contractility, and encourage functional recovery of the patient. It connects science and clinical practice enabling students and practitioners to develop their knowledge and use new clinical methods based on modern scientific understanding. All chapters have been revised, some with the collaboration of five specialists who are engaged in high level scientific research and clinical practice Biomechanical models are presented to provide a framework for action-specific training and exercise to improve performance Clinical guidelines are science- and evidence-based Emphasis is on new approaches to the delivery of neurological rehabilitation that increase the time spent in mental and physical activity, and the intensity of practice and exercise Up-to-date referencing

Training in Neurorehabilitation Sabine Lamprecht,Hans Lamprecht.2018-01-24 Training in Neurorehabilitation The importance of physical therapy for neurological disease cannot be underestimated. Stroke, for example, is the second leading cause of death worldwide, and its global effect is considerable, based on disability-adjusted life years. With an aging population, the risk of stroke increases exponentially with age, and accordingly, the number of patients increases as well. It follows that specially tailored neurorehabilitation regimens are crucial in helping patients return to the workplace and maintain their independence. This concise and practical work, created by authors with decades of experience in the practice and teaching of physical therapy, serves that purpose well, with its emphasis on the targeted use of training equipment to match the patients' exact needs. Key Features: Concise, practical, and goal-oriented Provides expert guidance in creating individualized training regimens with the goal of training and enhancing endurance, strength, and balance An emphasis on types of equipment and instructions for their use, tailored specifically the individual needs of patients All training exercises are well illustrated for optimal understanding Author team with more than 30 years' experience in practice and teaching of physical therapy Lamprecht's Training in Neurorehabilitation is certain to be an essential reference for all students and practitioners in physical therapy involved in the treatment of patients with neurological disorders.

Neurorehabilitation for Central Nervous System Disorders Frans van der Brugge.2017-10-27 This book describes the four most common central nervous disorders (Parkinson, stroke, dementia and multiple sclerosis) by focusing on the similarities of their symptoms. This analysis is necessary in order to determine the appropriate treatment method for individual patients. In physical therapy there are various methods available for treating patients affected by a neurological disease, yet the method presented here is the only one to include systematic interventions adapted to the patient's needs, which are determined by means of a health situation analysis. The book offers practical and applicable information for allied health professionals seeking interventions to help patients function better in their own environment. In addition, this book features updated information on the "van der Brugge method," focusing on a targeted program to stimulate movement in the elderly with dementia. This book will be of interest to neurologists and physiotherapist s.

Neurological Physiotherapy Susan Edwards. 1996 Intended for use by all physiotherapists working in the neurological field, this book shows how to analyze patient problems and select appropriate therapies for each situation. The emphasis is therefore on identification of symptoms in relation to the resultant impairment of movement, rather than on the detailed description of neurological conditions. Whilst it is important to understand the disease process of, for example, multiple sclerosis, the medical diagnosis has little bearing on the problems arising in terms of functional impairment.

Bobath Concept Sue Raine, Linzi Meadows, Mary Lynch-Ellerington. 2013-05-09 Authored by members of the British Bobath Tutors Association, *Bobath Concept: Theory and Clinical Practice in Neurological Rehabilitation* is a practical illustrated guide that offers a detailed exploration of the theoretical underpinning and clinical interventions of the Bobath Concept. The evolution of the Bobath concept is brilliantly captured in this volume. The recognition that the best inhibition may come from engaging the patient in normal activities is an example of the way one of the notions central to the original Bobath Concept has developed. In short, the Bobath Concept lies at the heart of an approach to neurorehabilitation that is ready to take advantage of the rapidly advancing understanding, coming from neuroscience, of brain function in, in particular, of the effects of and responses to damage, and the factors that may drive recovery. It is no coincidence that neuroplasticity figures so prominently in the pages that follow.' Emeritus Professor Raymond Tallis BM BCh BA FRCP FMedSci LittD DLitt FRSA This book guides the reader through general principles to more specific application of neurophysiological principles and movement re-education in the recovery of important areas, including moving between sitting and standing, locomotion and recovery of upper limb function. *Bobath Concept: Theory and Clinical Practice in Neurological Rehabilitation* will be invaluable to undergraduate and qualified physiotherapists /occupational therapists and all professionals working in neurological rehabilitation. Covers the theoretical underpinning of the Bobath Concept. Presents a holistic, 24-hour approach to functional recovery. Focuses on efficient movement and motor learning, to maximise function. Forges links between theory and clinical practice. Illustrated throughout.

Handbook of Neurological Rehabilitation Richard J. Greenwood, Thomas M. McMillan, Michael P. Barnes, Christopher D. Ward. 2005-08-16 Changes in the focus of neurological practice worldwide have led to the need for new standard texts that reflect the current state of this expanding area of clinical expertise. The second edition of the *Handbook of Neurological Rehabilitation* is a major reference source that fulfils this need, providing an invaluable resource for all professions that work with patients suffering from neurological disorders. It brings restorative neurology to the bedside and shows how a reiterative, goal-oriented, problem-solving training programme can benefit patients, sometimes on a scale not achieved by pharmacological or surgical interventions. The book is divided into three sections all of which have been updated. Section One explores the clinical and biological principles underpinning rehabilitation practice in the context of neurological disablement. Section Two describes the assessment, treatment, and management of the major physical, cognitive and behavioural impairments, and the resulting functional deficits that may follow or accompany neurological disease. The final section explores in more detail these problems and their management in relation to the more common specific disorders of the nervous system. The text emphasises the fact that rehabilitation is an ongoing process involving multidisciplinary problem-solving, goal-setting and education; in which organised care is more effective than unorganised care; and the breakdown of professional barriers within rehabilitation, to facilitate the use of combined treatment techniques, improves outcome. It describes the contribution made by neural reorganisation and compensatory mechanisms to recovery of function, focuses on the avoidance of secondary deficit, and explores the physical, cognitive, affective and behavioural problems that may occur after neurological damage. At a time when new medical technologies threaten to fragment the integrity of medical care at individual and societal levels, it is crucial that all those involved in the management of chronic neurological disease have a working knowledge of the contents of this book. Their perspective on clinical practice will then be truly integrated and holistic and their patients will benefit accordingly.
