E-Governance in India Bidisha Chaudhuri.2014-06-05 E-Governance has been one of the strategic sectors of reform in India since late 1990s under the rubric of 'good governance' agenda promoted by International Organizations. As India's policy focus changed towards economic liberalization, deregulation and privatization proliferating domestic and foreign investment, ICT (Information Communication Technology) has been one of the leading areas for such heightened investment. Consequently, there has been a burgeoning interest in deploying ICT, in revamping the public service delivery and eventually the overall system of governance. This book analyses e-Governance in India and argues that such initiatives did not take place in isolation but followed in the footsteps of broader governance reform agenda that has already made considerable impact on the discourses and practices of governance in India. Employing interdisciplinary methodology by combining approaches from the Political Sciences, Sociology and Postcolonial/ transcultural studies, this book presents a qualitative account of the policies and practices of e-Governance reform in India along with a detailed case study of the Common Services Centres (CSCs) Scheme under the National e-Governance Plan of the Government of India and its resultant impact on the overall system of governance. It unfolds general theoretical issues in terms of the relationship between technology and governance and the entanglement of politics, technology and culture in the complex whole of governance. This furthers our understanding of the impact of the transnational governance reform agenda on post-colonial and post-communist societies of the developing world. Making an important and original contribution to the emerging field of e-Governance and to the existing body of research on governance in general, this book will be of interest to students and scholars of Political Science, Political Sociology, South Asian Politics and Governance.

Internet of Things is a new revolution of the Internet that is rapidly gathering momentum driven by the advancements in sensor networks, mobile devices, wireless communications, networking and cloud technologies. Experts forecast that by the year 2020 there will be a total of 50 billion devices/things connected to the internet. This book is written as a textbook on Internet of Things for educational programs at colleges and universities, and also for IoT vendors and service providers who may be interested in offering a broader perspective of Internet of Things to accompany their own customer and developer training programs. The typical reader is expected to have completed a couple of courses in programming using traditional high-level languages at the college-level, and is either a senior or a beginning graduate student in one of the science, technology, engineering or mathematics (STEM) fields. Like our companion book on Cloud Computing, we have tried to write a comprehensive book that transfers knowledge through an immersive hands on approach, where the reader is provided the necessary guidance and knowledge to develop working code for real-world IoT applications. Additional support is available at the book's website: www.internet-of-things-book.com Organization The book is organized into 3 main parts, comprising of a total of 11 chapters. Part I covers the building blocks of Internet of Things (IoTs) and their characteristics. A taxonomy of IoT systems is proposed comprising of various IoT levels with increasing levels of complexity. Domain specific Internet of Things and their real-world applications are described. A generic design methodology for IoT is proposed. An IoT system management approach using NETCONF-YANG is described. Part II introduces the reader to the programming aspects of Internet of Things with a view towards rapid prototyping of complex IoT applications. We chose Python as the primary programming language for this book, and an introduction to Python is also included within the text to bring readers to a common level of expertise. We describe packages, frameworks and cloud services including the WAMP-AutoBahn, Xively cloud and Amazon Web Services which can be used for developing IoT systems. We chose the Raspberry Pi device for the examples in this book. Reference architectures for different levels of IoT applications are examined in detail. Case studies with complete source code for various IoT domains including home automation, smart environment, smart cities, logistics, retail, smart energy, smart agriculture, industrial control and smart health, are described. Part III introduces the reader to advanced topics on IoT including IoT data analytics and Tools for IoT.
