Advances in Plant Breeding Strategies: Fruits Jameel Al-Khayri, Shri Mohan Jain, Dennis V. Johnson. 2018-07-20 This book examines the development of innovative modern methodologies towards augmenting conventional plant breeding for the production of new crop varieties, under the increasingly limiting environmental and cultivation factors, to achieve sustainable agricultural production and enhanced food security. Two volumes of *Advances in Plant Breeding Strategies* were published in 2015 and 2016, respectively; Volume 1: Breeding, Biotechnology and Molecular Tools and Volume 2: Agronomic, Abiotic and Biotic Stress Traits. This is Volume 3: Fruits, which is focused on advances in breeding strategies for the improvement of individual fruit crops. It consists of 23 chapters grouped into three parts, according to distribution classification of fruit trees: Part I, Temperate Fruits, Part II, Subtropical Fruits, and Part III, Tropical Fruits. Each chapter comprehensively reviews the modern literature on the subject and reflects the authors' own experience.

Postharvest Physiology and Storage of Tropical and Subtropical Fruits S. K. Mitra. 1997 Tropical and subtropical fruits are becoming more important food items in countries where they are produced and also in an increasing number of importing countries in non-tropical zones. For many of the countries where they are grown these crops represent one of the primary ways of earning valuable foreign exchange. In the last few years, fruit production in most tropical and subtropical countries of the world has increased substantially, and most of the fruits grown in these regions now have established and growing markets in North America and Europe. The transport of tropical and subtropical fruits from areas of production to markets in temperate zones raises particular postharvest storage issues, while postharvest losses in the tropics themselves can be considerable. Whilst there are several texts addressing the postharvest needs of temperate fruits, there has not until now been a comprehensive volume dealing with tropical and subtropical fruits. This volume is the first book to deal with the postharvest storage, physiology and conservation of all of the economically important tropical and subtropical fruits. Contributors include leading research workers from throughout the world, including Europe, North, Central and South America, Australia, New Zealand, East and Southeast Asia and the Middle East. The resultant work represents a substantial contribution to this important and fast developing area. The book is essential reading for all horticultural researchers and students working with these crops and for growers, exporters and importers within the industries concerned with tropical and subtropical fruits.

Responses of Fruit Trees to Global Climate Change Fernando Ramirez, Jose Kallarackal. 2015-01-09 Global climate change is expected to produce increased carbon dioxide levels in the atmosphere, higher temperatures, aberrant precipitation patterns and a host of other climatic changes that would affect all life on this planet. This review article addresses the impact of climate change on fruit trees and the response of the trees to a changing environment. The response of fruit trees to increasing carbon dioxide levels, phenological changes occurring in the trees themselves due to increased temperature and the lower chilling hours especially in the temperate regions, ecophysiological adaptations of the trees to the changing climate, impact of aberrant precipitation, etc. are reviewed. There is very little data on the impact of rising CO₂ levels on fruit tree performance or productivity including the temperate region. Based on a large number of observations on the phenology, there is reason to believe that the flowering and fruiting of most species have advanced by quite a few days, but with variations in different crops and on different continents. The chilling hours have also grown shorter in many regions, causing considerable reductions in yield for several species. In the tropics, there is very little work on fruit trees; however, the available data show that precipitation is a major factor regulating their phenology and yield. The ecophysiological adaptations vary from species to species, and there is a need to develop phenological models in order to estimate the impact of climate change on plant development in different regions of the world. More research is also called for to develop adaptation strategies to circumvent the negative impacts of climate change.

Fruit Crops T. Radha, Lila Mathew. 2007 The book is a comprehensive and need oriented volume encompassing the latest and balanced information about various aspects of fruit culture (tropical & subtropical). Following is a sampling of topics covered. Introductory on Fruit Industry deals briefly with production statistics, social, nutritive and industrial relevance and importance of fruit production. Second provides a complete overview of all principles and practices associated with Orchard planning, Layout and Management in a very abridged manner. The third on Classification of fruit crops includes botanical, horticultural and environmental grouping in a very precise but meaningful manner. Following s give a detailed account on different aspects including origin, distribution, botany & varieties, classification, climate & soil requirements, propagation, cultivation methods, flowering, harvesting, post harvest methods and crop protection of different fruit crops coming under each group such as tropical, subtropical and arid & semi-arid fruits. IV is on tropical fruits - Banana, Guava, Mangosteen, Papaya Pineapple and Sapota. Breeding Plantation Tree Crops: Tropical Species Shri Mohan Jain, P.M. Priyadarshan. 2008-10-08 Tree species are indispensable to support human life. Due to their long life cycle and environmental sensitivity, breeding trees to suit day-to-day human needs is a formidable challenge. Whether they are edible or industrial crops, improving yield under optimal, sub-optimal and marginal areas calls for uni?ed efforts from the s-

entists around the world. While the uniqueness of coconut (kalpavriksha) (Sanskrit - meaning tree-of-life) marks its presence in every continent from Far East to South America, tree crops like cocoa, oil palm, rubber, apple, peach, grapes and walnut prove their environmental sensitivity towards tropical, sub-tropical and temperate climates. Desert climate is quintessential for date palm. Thus, from soft drinks to breweries to beverages to oil to tyres, the value addition offers a spectrum of products to human kind, enriched with nutritional, environmental, financial, social and trade related attributes. Taxonomically, tree crops do not confine to a few families, but spread across a section of genera, an attribute so unique that contributes immensely to genetic biodiversity even while cultivated at the commercial scale. Many of these species influence other flora to nurture in their vicinity, thus ensuring their integrity in preserving the genetic biodiversity. While wheat, rice, maize, barley, soybean, cassava and banana make up the major food staples, many fruit tree species contribute greatly to nutritional enrichment in human diet. The edible part of these species is the source of several nutrients that makes additives for the daily diet of humans, for example, vitamins, sugars, aromas and flavour compounds, and raw material for food processing industries. Tree crops face an array of agronomic and horticultural problems in propagation, yield, appearance, quality, diseases and pest control, abiotic stresses and poor shelf-life.

Temperate Fruit Crops S.N. Ghosh, Amit Kumar, Munibur Rehman, R.R. Sharma. 2018-09-26 In keeping in view, the challenges faced by the temperate fruit industry and a uniform syllabus approved by the ICAR for under graduate and PG students, the editors planned to write a book entitled 'Temperate Fruit Crops: Theory to Practical'. The book is an effort to summarize the current research information on temperate fruits in a comprehensive treatise. Authors attempted to provide the information and physiology behind current cultural practices as well as future trends. The book has 15 chapters on important temperate fruits such as apple, pear, apricot, peach, plum, cherry, strawberry, kiwi, almond, olive, hazelnut, pistachio nut, pecan nut, quince and walnut. Besides dealing with principles and cultivation practices of 15 temperate fruits, this book contains information on all difficulties faced by a farmer with practical application on all cultivation aspects. Efforts have been made to provide the maximum information about the nutritive and medicinal value, origin and distribution, area of cultivation, genus and different species, cytogenetic, botanical description including flowering and fruiting, physiology of flowering, fruit set and development, abiotic factors limiting production, varieties, suitable climate and soil, different methods of propagation including micro-propagation, all aspects of cultivation, insect-pest, diseases and their control, physiological disorder and their control measures, harvesting, yield, post harvest management and storage, value addition, economics of cultivation, trade and marketing, organic cultivation, effect of climate change and future research thrust of individual crop in such a way that the information may be easily transmitted among the scientists, researchers, students, policy makers and entrepreneur.

Temperate and Subtropical Fruit Production David Jackson, Norman Earl Looney, Michael Morley-Bunker. 2011 Effective fruit production requires general knowledge of fruit husbandry in areas such as nutrition, propagation, pruning and training, effects of climate and crop protection, as well as specific cultivation techniques for each fruit. Fully revised and expanded to include organic fruit production, this new edition provides a thorough introduction to the cultivation of fruit found throughout the temperate and subtropical regions of the world.

Temperate and Subtropical Fruit and Nut Crops Ron G. Weir, Geoffrey Charles Cresswell. 1993 First in a series of five books on plant nutrient disorders. This volume describes and illustrates deficiencies and toxicities of essential elements in a range of temperate and subtropical tree fruits, vines, berries and nuts, and explains how to distinguish them from non-nutritional problems.

Tropical Fruits Henry Y. Nakasone, Robert E. Paull. 1998 A wide variety of fruits is grown in the tropics, under a range of climatic conditions and soil types. Some have been widely used both within the tropics and also exported to temperate countries for many years, whereas others are currently grown almost exclusively for local or regional use. However, consumer demands and improvements in postharvest treatment have meant that the number of species available in temperate markets is increasing. This book provides a broad survey of all aspects of tropical fruit production and usage. It begins by defining the climate and soils of the tropics and outlining the general principles of cultivation and postharvest handling. Each type of fruit is then examined in terms of botany, origin and distribution, ecology, genetics and cultivar development, culturing practices, pests and diseases, harvest and postharvest handling and utilization. Finally, fruits which have potential for future development are considered. The book is essential reading for students and professionals in horticulture, agronomy and food science.

Temperate Fruit Crops in Warm Climates A. Erez. 2013-04-17 As a member of the working group (WG) on Temperate Zone Fruit Trees in the Tropics and Subtropics of the International Society for Horticulture, I was aware of the lack of readily available information needed in many warm-climate locations where temperate fruit crops are grown. The founder of this WG, Frank Dennis, Jr., was motivated to encourage knowledge transfer by sharing knowledge with many developing countries. We shared his drive and in presenting this book we believe we are doing a service to all persons interested in temperate fruits, but especially to those in tropical and subtropical countries, many of which are developing countries interested in growing these crops and lacking the knowledge needed. In this book, we have collected information covering a variety of different aspects of growing temperate fruit crops in warm climates. As this is the first time such an evaluation of these species has been done, interesting and novel aspects of tree development and fruiting are presented, with stress on elements like dormancy and irrigation that are not of such basic concern in the natural of the temperate zones. We are living in a transition age; horticultural studies habitat are changing and expertise such as can be found in the array of participants in this book is probably not going to be easily found in the future. I hope that this book will broaden our understanding of the fruiting Temperate Zone tree in general and of its adaptation to warm climates, in particular.

Tropical Fruits Robert E. Paull, Odilo Duarte. 2011 This book examines economically important horticultural crops selected from the major production systems in temperate, subtropical and tropical climatic areas. The general aspects of the tropical climate, fruit production techniques, tree management and postharvest handling and the principal tropical fruit crops that are common in temperate city markets are discussed. The taxonomy, cultivars, propagation and orchard management, biotic and abiotic problems and cultivar development of these fruit crops are also highlighted.

Underutilized Subtropical Fruits Sushil Kumar Shukla, Sanjeev Kumar. 2009 India has emerged as major stakeholder in the global horticulture scenario accounting for 10.9% of the world fruit production, with the total fruit production of 58.7 million tonnes from 5.5 million hectares. In view of the burgeoning population pressure, it is often not possible to get good piece of fertile land for cultivation of fruit crops.

Handbook of Environmental Physiology of Fruit Crops Bruce Schaffer, Peter C. Andersen.2018-05-04 These exciting new companion handbooks are the only ones of their kind devoted solely to the effects of environmental variables on the physiology of the world's major fruit and nut crops. Their cosmopolitan scope includes chapters on tropical and temperate zone species written by scientists from several continents. The influence of environmental factors, such as irradiance, temperature, water and salinity on plant physiology and on vegetative and reproductive growth, is comprehensively discussed for each crop. In addition to being a thorough and up-to-date set of textbooks, the organization of the two volumes makes them an excellent reference tool. Each chapter focuses on a single crop, or a group of genetically or horticulturally related crop, and is appropriately divided into subsections that address individual environmental factors. Some chapters emphasize whole-plant physiology and plant growth and development, while other chapters feature theoretical aspects of plant physiology. Several chapters provide botanical background discussions to enhance understanding of the crop's response to its environment.

Temperate Fruits S K Mitra.2020 This book was first published in 1991 and was well received by students, teachers and researchers in many universities and institutes in India and abroad. In the past 28 years (since its first publication), tremendous progress have been made in temperate fruit research, notably in developing varieties and rootstocks, canopy management, understanding the flowering physiology, storage technology, biological control of pests and diseases, resistance breeding, biotechnology, etc., Revision of the book with updated information was considered necessary. In the process of a comprehensive literature survey it was felt impossible to compile all the information in one volume. This enlarged edition on temperate fruits is, therefore, published in two volumes. The first volume consists of pome and stone fruits (apples, pears, peaches, plums, apricots and cherries) in more than 550 pages. The second volume deals with temperate nuts and berries (almonds, chestnuts, hazelnuts, pecans, pistachios, walnut, strawberries, currants, gooseberries, raspberries, blueberries and cranberries) in about 650 pages. Apart from through revision with updated scientific information on various aspects of mentioned pome, stone, nuts and berries, substantial reorganization of the text has been made. Emphasis has been laid to include released cultivars and rootstocks, recent trends in propagation and orchard management, pruning and canopy management, nutrition and tissue analysis, water management, improved technology for harvesting, postharvest handling, storage and ripening. Special emphasis has been laid to include the development in breeding and improvement through biotechnological approaches like molecular markers, genetic transformation, genetic map and microbes for N and P input. Other information like organic production technology, protected cultivation and impact of climate change are included, where sufficient information is available. Though the subject is vast, this two volumes book presents the concepts in a condensed, informative and lucid manner. It will be immense help to the students, teachers and researchers of horticulture, plant science, plant physiology and plant protection.
