**Kuby Immunology** Jenni Punt, Sharon Stranford, Patricia Jones, Judy Owen.2018-10-16 Janis Kuby's groundbreaking introduction to immunology was the first textbook for the course actually written to be a textbook. Like no other text, it combined an experimental emphasis with extensive pedagogical features to help students grasp basic concepts. Now in a thoroughly updated new edition, Kuby Immunology remains the only undergraduate introduction to immunology written by teachers of the course. In the Kuby tradition, authors Jenni Punt, Sharon Stranford, Patricia Jones, and Judy Owen present the most current topics in an

experimental context, conveying the excitement of scientific discovery, and highlight important advances, but do so with the focus on the big picture of the study of immune response, enhanced by unsurpassed pedagogical support for the first-time learner. Punt, Stranford, Jones, and Owen bring an enormous range of teaching and research experiences to the text, as well as a dedication to continue the experiment-based, pedagogical-driven approach of Janis Kuby. For this edition, they have worked chapter by chapter to streamline the coverage, to address topics that students have the most trouble grasping, and to continually remind students where the topic at hand fits in the study of immunology as a whole.

**Immunology of the Skin** Kenji Kabashima.2016-03-10 This book reviews the role of each cell subset in the skin, providing the basics for understanding skin immunology and the mechanisms of skin diseases. The skin is one of the immune organs and is continually exposed to foreign antigens and external stimuli that must be monitored and characterized for possible elimination. Upon exposure to foreign antigens, the skin can elicit a variety of immune responses in harmony with skin components that include keratinocytes, dendritic cell subsets, mast cells, basophils, fibroblasts, macrophages, gamma-delta T cells, neutrophils, myeloid-derived suppressor cells, vascular and lymphatic cells, hair follicles, platelets, and adipose tissues, among others. In the past 10 years, knowledge of immunology has expanded drastically in areas such as innate immunity (Toll-like receptors, C-type lectins), and host defenses to bacteria and viruses, and this increased knowledge has led to the development of more effective treatment of psoriasis and other skin diseases. This book provides updates on the mechanisms of skin diseases including contact dermatitis, atopic dermatitis, psoriasis, urticaria, drug eruption, bullous diseases, anaphylaxis, graft-versus-host disease, rosacea, lymphoma, photodermatology, and collagen vascular diseases. Understanding the basics of skin immunology will help clinicians and dermatologists use new therapeutics such as biologics efficiently. Serving as an intermediary between basic science and clinical medicine, this book gives readers the opportunity to understand and marvel at the mystery and fascination of skin immunology.

**Lectin in Host Defense Against Microbial Infections** Shie-Liang Hsieh.2020-03-09 This book systemically presents the latest research on lectins, covering all the major topics in the field, including the heterocomplex of lectins and Toll-like receptors, protective versus pathogenic functions in connection with microbial infections, and novel strategies for enhancing host immunity against infectious diseases caused by viruses, bacteria, and fungi. Lectins are a large group of glycan-binding proteins that recognize diverse glycan and non-glycan structures expressed on prokaryotic and eukaryotic cells, and are vital to cell-cell interactions, the attachment of microbes to host cells, and the recognition and activation of immune responses to exogenous and endogenous danger signals. The composition and structure of microbes are complex and include numerous 'pathogen-associated molecular patterns' or 'damage-associated molecular patterns'. As such, microbes' interactions with immune cells activate multiple innate immunity receptors and produce distinct inflammatory reactions, which can be protective to contain microbial invasion, or pathogenic to cause tissue damage and shock syndrome in the host. The book shares lessons learned from state-of-the art research in this field, highlights the latest discoveries, and provides insightful discussions on lectin-mediated inflammatory reactions, while also outlining future research directions.

**Plant Lectins** A. Pusztai.1991 This volume surveys the chemistry, biochemistry, biosynthesis, metabolism and pharmacological properties of lectins. Lectins, which are most commonly found in plants, are widespread natural products with striking biological activities. Their specific ability to recognise and bind to simple or complex saccharides facilitates their role as effective information protein molecules. As agents of cell-to-cell recognition, lectins promote symbiosis between plants and specific nitrogen-fixing soil bacteria. As natural defensive molecules, they can protect plants against predators such as bacteria, fungi and insects. As part of our diet, lectins are powerful exogenous growth factors in the small intestine and influence our health, the digestive function and the bacterial ecology of the alimentary tract. Lectins are also important research tools in preparative biochemistry and cell science.

**Innate Immunity of Plants, Animals and Humans** Holger Heine.2007-12-07 This book has been cunningly designed to provide an overview of our current knowledge about the innate immune systems of these three types of organisms. **Innovative Medicine** Kazuwa Nakao, Nagahiro Minato, Shinji Uemoto.2015-10-13 This book is devoted to innovative medicine, comprising the proceedings of the Uehara Memorial Foundation Symposium 2014. It remains extremely rare for the findings of basic research to be developed into clinical applications, and it takes a long time for the process to be achieved. The task of advancing the development of basic research into clinical reality lies with translational science, yet the field seems to struggle to find a way to move forward. To create innovative medical technology, many steps need to be taken: development and analysis of optimal animal models of human diseases, elucidation of genomic and epidemiological data, and establishment of "proof of concept". There is also considerable demand for progress in drug research, new surgical procedures, and new clinical devices and equipment. While the original research target may be rare diseases, it is also important to apply those findings more broadly to common diseases. The book covers a wide range of topics and is organized into three complementary parts. The first part is basic research for innovative medicine, the second is translational research for innovative medicine, and the third is new technology for innovative medicine. This book helps to understand innovative medicine and to make progress in its realization.

**Innate Immunity: Resistance and Disease-Promoting Principles** G. Hartmann, H. Wagner.2013-06-05 Our understanding of the complex innate immune response is increasing rapidly. Its role in the protection against viral or bacterial pathogens is essential for the survival of an organism. However, it is equally important to avoid unregulated inflammation because innate immune responses can cause or promote chronic autoinflammatory diseases such as gout, atherosclerosis, type 2 diabetes or certain aspects of the metabolic syndrome. In this book leading international experts in the field of innate immunity share their findings,

define the 'state of the art' in this field and evaluate how insight into the molecular basis of these diseases could help in the design of new therapies. A tremendous amount of work on the innate immune response has been done over the last fifteen years, culminating in the 2011 Nobel Prize in Physiology/Medicine awarded for the discoveries of Toll genes in immunity in flies, membrane-bound Toll-like receptors in mammals, and dendritic cells as initiators of adaptive immunity.

**C-Type Lectin Receptors in Immunity** Sho Yamasaki. 2016-03-22 The book presents the latest findings on C-type lectin receptors, focusing on individual receptors and their signaling. In recent years there have been great advances in the understanding of the function of these receptors as a newly emerging family of pattern-recognition receptors (PRRs) for pathogen-associated molecular patterns (PAMPs) and damage-associated molecular patterns (DAMPs). Comprising four parts: ITAM-coupled Activating Receptors; HemITAM-bearing Receptors; ITIM-bearing Receptors; and Other Receptors and Related Topics, this comprehensive review covers a broad range of C-type lectin receptors. The updated information on C-type lectin receptors and their ligands provided will appeal to a wide readership, from basic immunologists to physicians and surgeons. In addition, sections on novel drug development make this a valuable resource for pharmaceutical scientists.

**C-Type Lectins in Immune Homeostasis** Sho Yamasaki. 2020-10-31 This book focuses on C-type lectin receptors, a newly emerging family of pattern-recognition receptors (PRRs) and a crucial part of the human innate immune system. Above all, the authors highlight these receptors' role in the recognition of pathogen-associated molecular patterns (PAMPs) and damage-associated molecular patterns (DAMPs) - one of the first steps in responding to foreign and potentially dangerous structures in the human body. The respective chapters chiefly examine various C-type lectin receptors, their corresponding ligands, and signalling. In addition to offering immunologists and clinicians important insights from the latest research, they may also provide novel points of departure for future drug development.

**Chemical Probes of Dendritic Cell C-type Lectin Receptors** .2014 Dendritic cells (DCs) are professional antigen-presenting cells that possess the unique ability to induce primary immune responses. They directly capture invading pathogens and transmit danger signals to the adaptive immune system, which ultimately initiates a robust immune response. DCs sense invading pathogens through an arsenal of receptors that recognize highly conserved, pathogenic epitopes. These receptors include C-type lectin receptors (CLRs) that bind to pathogenic glycans to facilitate pathogen uptake and degradation. In addition, CLRs also complex host glycans to mediate DC locomotion and cell-cell communication. Despite a clear importance in immunity, many CLRs are exploited by pathogens for nefarious purposes. For example, DC-SIGN is co-opted by pathogens, including HIV-1 and Mycobacterium tuberculosis, to facilitate infection and dissemination. However, the mechanisms that pathogens use to exploit DC-SIGN remain poorly understood. This thesis describes strategies for ligand synthesis that can afford probes of DC-SIGN function. These strategies can be generalized and applied to any CLR of interest. In light of emerging evidence that glycan structure may affect CLR function, I designed polymers bearing pendant carbohydrates (glycopolymers) to function as glycan surrogates. By employing glycopolymers of defined composition, we observed that glycopolymer valency affects both DC-SIGN-mediated internalization and trafficking within the cell. Studying CLRs is challenging due to their overlapping ligand specificities. To target DC-SIGN, we previously generated non-carbohydrate glycomimetics from (-)-shikimic acid that mimic the DC-SIGN ligand, D-mannose. By expanding this approach, I have demonstrated that these compounds can be converted into probes that elicit DC-SIGN function (e.g. internalization, signaling). Moreover, I have developed a divergent synthetic route to non-natural epimers of shikimic acid, thus allowing access to glycomimetics that mimic other CLR ligands. This strategy will therefore allow access to glycomimetic agonists to target any CLR of interest. Finally, I have outlined a methodology to probe antigen presentation in DCs. Using glycopolymers bearing peptide cargo, we are poised to explore two distinct mechanisms of antigen presentation in DCs. We envision this strategy will elucidate the putative roles CLRs may play in antigen presentation. Moreover, this approach may validate CLRs as potential therapeutic targets for vaccine design.

**Essentials of Glycobiology** Ajit Varki, Maarten J. Chrispeels. 1999 Sugar chains (glycans) are often attached to proteins and lipids and have multiple roles in the organization and function of all organisms. Essentials of Glycobiology describes their biogenesis and function and offers a useful gateway to the understanding of glycans.

**Role of Syk-coupled C-type Lectin Receptors in T Cell Immunity to Fungal Stimuli** F. B. Osorio Olivares. 2010 Innate signals are fundamental to determine the class of adaptive response against infection. The translation of microbial signatures into adaptive immunity is mediated by pattern recognition receptors (PRRs), which are expressed in specialized leukocytes called dendritic cells (DCs) and results in responses matched to the nature of the offending microbe. Here, I provide evidence that two Syk-coupled C-type lectin receptors (CLRs), Dectin-1 and Dectin-2, act in the coordination of adaptive immune responses to fungal stimuli and fungal pathogens. DC activated via Dectin-1 are strong elicitors of IL-17 production by CD4+ T cells. Results presented in this thesis demonstrate that Dectin-1 signalling in DCs results in the generation and Foxp3+IL-17+ T cells, a cell type that defies either regulatory or Th17 classification. This process is dependent on IL-23, which is produced by DCs upon Dectin-1 ligation. In addition, this work identified an additional CLR responsible for the induction of Th17 responses during the course of fungal infections. This thesis demonstrates that Dectin-2 is a second Syk-coupled PRR involved in DC activation by fungi. In a model of Candida albicans systemic infection, Dectin-2 is essential for the induction of Th17 responses to the organism. Finally, I have generated tools to study responses of T cells specific for a fungal-associated antigen. Furthermore, I provide preliminary evidence regarding the activation, proliferation and trafficking of antigen-specific CD4+ and CD8+ T cells during systemic fungal infections.
