Development of a Screening Tool for Safe Wheelchair Seating. 2005 Most elderly nursing home residents who need wheelchairs are not being assessed individually to ensure proper prescription for safe and effective mobility. This study evaluated the use of a new screening tool, the Resident Ergonomic Assessment Profile for Seating (REAPS). Methods: This descriptive study design examined the reliability and validity of the REAPS in a Veterans nursing home. Fifty subjects (mean age = 78) were screened by four raters and an independent criterion expert. Test-retest reliability was performed on 18 subjects. Other measures included resident discomfort, mobility, and posture. Results: Although interrater agreement varied according to the items on the REAPS, ratings suggested reasonable agreement among various raters and the seating expert, and moderate overall sensitivity. REAPS scores provided by the raters were positively correlated with expert opinion, as well as performance measures of mobility and head angle. Conclusions: The REAPS is intended to serve as a brief, easily administered screen to identify individuals in need of formal wheelchair seating evaluation. The results of this study suggest that, pending minor revisions, nursing home staff members with minimal instruction can use this tool to conduct this type of screening. Future development and research is warranted to explore the efficacy of the REAPS across long-term care settings in both VA and community facilities.

**The Promise of Assistive Technology to Enhance Activity and Work Participation** National Academies of Sciences, Engineering, and Medicine,Health and Medicine Division,Board on Health Care Services,Committee on the Use of Selected Assistive Products and Technologies in Eliminating or Reducing the Effects of Impairments.2017-08-01 The U.S. Census Bureau has reported that 56.7 million Americans had some type of disability in 2010, which represents 18.7 percent of the civilian noninstitutionalized population included in the 2010 Survey of Income and Program Participation. The U.S. Social Security Administration (SSA) provides disability benefits through the Social Security Disability Insurance (SSDI) program and the Supplemental Security Income (SSI) program. As of December 2015, approximately 11 million individuals were SSDI beneficiaries, and about 8 million were SSI beneficiaries. SSA currently considers assistive devices in the nonmedical and medical areas of its program guidelines.

During determinations of substantial gainful activity and income eligibility for SSI benefits, the reasonable cost of items, devices, or services applicants need to enable them to work with their impairment is subtracted from eligible earnings, even if those items or services are used for activities of daily living in addition to work. In addition, SSA considers assistive devices in its medical disability determination process and assessment of work capacity. The Promise of Assistive Technology to Enhance Activity and Work Participation provides an analysis of selected assistive products and technologies, including wheeled and seated mobility devices, upper-extremity prostheses, and products and technologies selected by the committee that pertain to hearing and to communication and speech in adults.

**Learning disabilities screening and evaluation guide for low- and middle-income countries** Anne M. Hayes, Eileen Dombrowski, Allison H. Shefcyk, Jennae Bulat.2018-04-29 Learning disabilities are among the most common disabilities experienced in childhood and adulthood. Although identifying learning disabilities in a school setting is a complex process, it is particularly challenging in low- and middle-income countries that lack the appropriate resources, tools, and supports. This guide provides an introduction to learning disabilities and describes the processes and practices that are necessary for the identification process. It also describes a phased approach that countries can use to assess their current screening and evaluation services, as well as determine the steps needed to develop, strengthen, and build systems that support students with learning disabilities. This guide also provides intervention recommendations that teachers and school administrators can implement at each phase of system development. Although this guide primarily addresses learning disabilities, the practices, processes, and systems described may be also used to improve the identification of other disabilities commonly encountered in schools.

**Evaluating, Selecting, and Using Appropriate Assistive Technology** Jan C. Galvin, Marcia Joslyn Scherer.1996 Assistive technology can be a

powerful tool but only if it has been designed with consumer input, selected with full knowledge of what is available, how it works, how it interacts with the environment, and most importantly, selected with full consumer knowledge and cooperation. Too often the technology selected fails the consumer because it was chosen without regard to these parameters. Poorly chosen technology leads to high abandonment rates and wasted third-party-payor money. This book attempts to remedy this situation.
