Procedures for Capital Budgeting Under Uncertainty Stewart C. Myers. 2015-06-25 Excerpt from Procedures for Capital Budgeting Under Uncertainty Accordingly, the cost of capital is defined as the minimum expected rate of return on a project (with given risk characteristics) such that share price is increased by the project's adoption. The cost of capital is thus used as a hurdle rate, with the height of the barrier depending on the risk characteristics of the project compared with those of alternative investments open to shareholders. It is easy to point out deficiencies in this NPV approach - for instance, most authors are conspicuously vague about how to measure the hurdle rates appropriate to projects with different risk characteristics. The important point for our purposes, however, is that the NPV approach presumes projects to be risk-independent. That is, it presumes that the value of project B does not depend on the risk characteristics of the firm's existing assets, or of other investments the firm may undertake. 2. Treat capital budgeting as a problem of portfolio selection. - The framework for portfolio selection originally presented by Markowitz [10] [11] is now well-known and widely accepted, although difficulties in assembling data and performing the required calculations have limited its use in practice. The similarity between the tasks of portfolio selection and capital budgeting has led Lintner, among others, to conclude that the problem of determining the best capital budget of any given size is formally identical to the solution of a security portfolio analysis. Advanced Capital Budgeting Harold Bierman, Jr., Seymour Smidt. 2014-02-04 Written by authors of established texts in this area, this book is a companion volume to the classic *The Capital Budgeting Decision*. Exploring this key topic in corporate finance the authors examine the complexities of capital budgeting as well as the opportunities to improve the decision process where risk and time are important elements. Containing 'Global Aspects' sections that cover cross-border decision-making, this book also emphasizes the application of capital budgeting techniques to a variety of issues, including the hugely significant 'buy versus lease' decision that cost corporations billions each year. It gives in-depth coverage to: real options - the value of a project must take into consideration the flexibility that it provides management, acknowledging the option of making decisions in the future when more information is available decomposing cash flows - a project consists of many series of cash flows and each series deserves its own specific risk-adjusted discount rate. Decomposing the cash flows of an investment highlights the fact that while managers are generally aware that divisions and projects have different risks, too often they neglect the fact that the cash flow components may also have different risks, with severe consequences on the quality of the decision-making. Designed to assist those making business decisions at all levels, this volume is essential reading for all those working in or studying capital budgeting.

Implementing Capital Budgeting Techniques Harold Bierman. 1988 Rev. ed. of: Implementation of capital budgeting techniques. c1986. Includes index. Bibliography: p. 89-101.

Capital Budgeting Don Dayananda, Richard Irons, Steve Harrison, John Herbohn, Patrick Rowland. 2002-10-17 This book explains the financial appraisal of capital budgeting projects. The coverage extends from the development of basic concepts, principles and techniques to the application of them in increasingly complex and real-world situations. Identification and estimation (including forecasting) of cash flows, project appraisal formulae, and the application of net present value (NPV), internal rate of return (IRR) and other project evaluation criteria are illustrated with a variety of calculation examples. Risk analysis is extensively covered by the use of risk adjusted discount rate, certainty equivalent, sensitivity, simulation and Monte Carlo analysis. The NPV and IRR models are further applied to forestry, property and international investments. Resource constraints are introduced to the capital budgeting decisions with a variety of worked examples using linear programming technique. All calculations are extensively supported by Excel workbooks on the Web, and each chapter is well reviewed by end of chapter questions.

Capital Budgeting Under Conditions of Uncertainty R.L. Crum, F.G.J. Derkinderen. 2012-12-06 The business environment, particularly after the continuing oil crises of the seventies, can be characterized as evolving rapidly in complex and often unpredictable ways. Such things as high interest and inflation rates, fluctuating exchange rates, volatile commodity markets, and increasing political turmoil have led to a situation in which explicit consideration of environmental dynamics is becoming much more important for successful business planning than was true in the past. Companies are finding that it is no longer possible to conduct business as usual under these changing circumstances. Rather, decision makers are having to be more cognizant of the many sources of uncertainty that could have serious impacts on the continued prosperity of the firm, as well as of actions that can be taken so that the company can thrive in spite of these greater uncertainties. Businesses have responded to these challenges by giving more thorough consideration to strategic issues. Whereas in the past the steady progression of markets and technology was taken for granted, the uncertainties associated with increased worldwide competition, as well as with other exogenous factors, have introduced companies to think more about flexibility. This involves not only how best to exploit profitable current options, but also how to position themselves at present to be able to respond appropriately to threats and opportunities as they arise in the future. Unfortunately, in this redirection of outlook, the finance profession has not kept pace.
