Flat Roof Design Building Research Establishment.1986 The term flat roof is used in UK codes and standards to denote a roof having a slope of up to 10 deg. (about 1 in 6) to provide drainage. The term 'low-pitched ' is also used to denote the upper end of this range. Flat roofs are characterised by having a continuous waterproof layer. They have been used on buildings where the traditional pitched roof design, with a discontinuous waterproof layer, could have been used. There are, though, other cases, especially on large buildings of irregular plan, where they may provide the only feasible solution. Experience has shown that high maintenance costs can occur with flat roofs. Many of the problems investigated by BRE in the UK could have been avoided at the design and construction stages if designers and constructors had appreciated fully the limitations of the various design options, and how appropriate each was to the particular building. It is possible to design flat or low-pitched roofs that will give satisfactory service and acceptable maintenance costs provided that sound design is supported by correct selection of materials and components, and followed by good standards of workmanship during construction and planned inspection and maintenance in service.
