**Design of Bridges** K. Raju. 2018-02-28 The fifth edition of this updated text follows the philosophy of limit state design for the design of various types of road bridge. An integrated design approach involving the limit states of strength and serviceability has been followed for the design of reinforced, prestressed and steel bridges commonly used for national highway crossings. The revised fifth edition presents in a lucid manner the designs.

**FORTTRAN-95 Program** Andinet Zeleke Bekele. 2020-02-21 Master's Thesis from the year 2013 in the subject Engineering - Civil Engineering, grade: Very Good (A), Addis Ababa University (Addis Ababa University Institute of Technology), course: Structural Engineering, language: English, abstract: This thesis focuses on the development of a FORTRAN 95 program for the structural design of the superstructure part of a concrete slab culvert. FORTRAN 95 is a programming language used in the fields of scientific, numerical, and engineering fields. In this thesis, this language has been used to develop the program for the structural design of reinforced concrete slab culvert deck. The input data for at grade and at fill slab culverts are saved on a note pad in the external file folder which constitute the material properties, geometric features and proposed diameter of reinforcement bars of the slab culvert and its deck in the folder which contains FORTRAN 95 program. The output data is written on the note pad in the external folder based on the format assigned for each output in the folder which contains the design results of slab deck thickness and area, spacing and length of main, distribution and temperature reinforcement bars. Besides Edge beam design parallel to the traffic is executed and shown in the output result by the developed program. Concrete slab culvert is an important structure used to convey trucks and pedestrian along a road corridor or in one of a range of other situations. This structure is highly constructed in highway road projects in Ethiopia. In this study, a FORTRAN program is developed for the structural design of reinforced concrete slab culvert deck according to the provisions given in AASHTO LRFD Bridge 2005 Edition. The developed program is expected to assist the structural designers and users to design the superstructure part of a reinforced concrete slab culvert deck efficiently with great accuracy. Both at grade and at fill slab deck thicknesses are computed according to the specification specified in AASHTO LRFD Bridge 2005 Edition. The reinforcement bars are also designed based on the requirements specified in the code. Within the context of this work the program is developed in four steps. The first step is to define and analyze the problem; the second step is to develop an optimal solution and designing the program, the third step is coding the program and the final step is testing and documenting the program.

The Design of Prestressed Concrete Bridges Robert Benaim. 2007-12-06 Examining the fundamental differences between design and analysis, Robert Benaim explores the close relationship between aesthetic and technical creativity and the importance of the intuitive, more imaginative qualities of design that every designer should employ when designing a structure. Aiding designers of concrete bridges in developing an intuitive understanding of structural action, this book encourages innovation and the development of engineering architecture. Simple, relevant calculation techniques that should precede any detailed analysis are summarized. Construction methods used to build concrete bridge decks and substructures are detailed and direct guidance on the choice and the sizing of different types of concrete bridge deck is given. In addition guidance is provided on solving

recurring difficult problems of detailed design and realistic examples of the design process are provided. This book enables concrete bridge designers to broaden their scope in design and provides an analysis of the necessary calculations and methods.

**Hydraulic Loss Coefficients for Culverts** Blake P. Tullis.2012 Research in the area of culvert hydraulics has centered on concrete box culverts and circular corrugated metal pipe culverts. The hydraulic analyses of these culvert types have been well defined for conventional installations, but not for environmentally sensitive and nontraditional culverts. It is desirable to design and construct some culvert crossings to minimize their impact on the natural environment. Culverts are now being designed to maintain natural velocities and minimize turbulence to allow migratory species to pass through the culvert barrel. Such designs may add baffles on the invert, bury the culvert invert, or use bottomless culverts to provide for a natural stream invert. Other designs use larger and wider culverts to reduce the amount of contraction and acceleration.

*Structural Design of Box Culverts* Hatem M Elbadry.2023-07-15 This manual has been developed to simplify and facilitate the structural design of box culverts and keep pace with developments in structural analysis technologies and employ them to reach the best use. It is considered as a practical book suitable for the current methods used in the design, and since the finite element programs have become a basic requirement for design in most of professional companies, it is necessary to link these programs to the manual solutions and understand the loads, analysis and outputs to reach the worst-case scenarios without forgetting the economic factors which is located in the second place after safety. The author has relied on the basic AASHTO LRFD Bridge Design Specification, Seventh Edition (2014). For more details, please visit <https://centralwestpublishing.com>

**Development of Design Criteria for Reinforced Concrete Box Culverts** Roger Díaz de Cossío,Chester Paul Siess.1959 The bases for the calculation of moments and shears in culverts, and in similar structures having members with portions that can be considered infinitely stiff, are given. Expressions are also given for the moments at midspan and column face sections of rectangular one-

celled reinforced concrete box culverts. The basic strength characteristics in shear and flexure, the limitations of the expressions presented, and the recommended factors of safety are discussed. The applications of the above criteria to the specific design of one-celled reinforced concrete box culverts, with recommendations for allowable bond stresses and for placing and spacing of reinforcement are given. Finally, design aids are presented in three appendixes. Appendix A contains charts for midspan and column face moments in one-celled rectangular reinforced concrete box culverts having a wide range of dimensions, for two ratios of lateral to vertical load, 1/3 and 1/2; Appendix B contains interaction diagrams for yield and ultimate capacities in flexure; and Appendix C contains charts for cracking load capacities of members.
