Pharmacology for Chemists Raymond Hill, Terry Kenakin, Tom Blackburn. 2017-10-25 Assuming little previous knowledge of biology, this book aids graduate chemists to close the gap in their knowledge of pharmacology and make the link between medicinal chemistry and the way in which drugs act on the body. The availability of receptor structures has revolutionized drug discovery and development necessitating an up-to-date source of information for chemists entering this new pharmacological world. Chapters, written by experts with an appreciation of most graduate chemists' knowledge, explain the history of

pharmacology, the relationship between receptor structure and function and receptor pharmacology relevant to drug design. Importantly, as drugs are normally discovered in test rather than therapeutic systems, this text describes how pharmacology provides methods to characterize drug activity through scales that allow prediction of drug effect in all systems. Moreover, it outlines the relationship between drug distribution in the body and the action of drugs in particular organ systems relevant to disease. Readers will also find information on pharmacokinetics and drug metabolism, safety pharmacology and toxicology, clinical and regulatory pharmacology and the use of imaging techniques. Carefully edited for relevance to the modern chemist, this unique textbook will be an essential resource for chemists planning to work in drug discovery, or postgraduate students and practicing chemists interested in expanding their pharmacology knowledge

Adverse Cutaneous Drug Reactions to Cardiovascular Drugs Esen Özkaya, Kurtuluş Didem Yazganoğlu. 2014-11-15 Adverse cutaneous drug reactions (ACDR) are among the most frequent events in patients receiving drug therapy. Cardiovascular (CV) drugs are an important group of drugs with potential risk of developing ACDR especially in elderly as marketing of more new drugs and their prescription continue to increase. However, like with most other drugs the exact incidence of cutaneous side effects from CV drugs is difficult to estimate due to sporadic reporting. Moreover, a reliable designation of a certain drug as the cause of a certain type of reaction can rarely be made. Apart from the well-known angioedema/urticaria from ACE inhibitors, lichen planus / lichenoid reaction from beta adrenergic blockers

and photosensitivity from thiazid diuretics, ACDR from CV drugs might be seen in a wide spectrum extending to rare but life-threatening conditions such as erythroderma, Stevens-Johnson syndrome, toxic epidermal necrolysis or drug hypersensitivity syndrome. In this comprehensive review, the reported types of ACDR to CV drugs will be discussed according to drug class and the type of dermatologic reaction with special emphasize on cross-reactions and the role of patch testing in diagnosis.

Drugs for Heart Disease John Hamer. 2013-11-11 This book is the outcome of a cardiologist switching to clinical pharmacology in mid-career and may be seen as representing the interface between the two disciplines. In this second edition I have not tried to be encyclopaedic, but have asked the contributors to give a brief account of current practice, so that it represents the present state of cardiac therapeutics. Although some contributors are from Bart's, I have tried to spread my net widely and produce a general view from the English speaking world. I hope this will be enough to draw the teeth of my colleagues who will react at once to say that 'this is not what we do at Bart's.' Some chapters, mostly the early ones, are drug orientated and describe the use and properties of individual groups of drugs. Other later chapters are disease orientated and describe the use of various groups of drugs in different conditions, such as angina or hypertension. This necessarily leads to some overlap, but I
